Crassin'idice, n. pl. (Zokit, rud Genl) A famity of mol-
husca, order Lamellibranchiuta, calted nlso $\boldsymbol{A}$ startider and Cycladidae. They are elosely allied to the Feneride, and ure intercsting chiefly with reference to geology: The fossil species are very numerous, commencing with the lias period, und are distrilinted over the whole world. They may be regarded as having kiven place to the Veneride, which commenced with the oblitic peried, and are among the most abundaat bivalve mollusca of the
jresent time.
Crassitude.
Crasisitnde, $n$. [Lat, crassitudo, from crassus.] GrossThe greater crassitude and cruveness.

Crassinla'cese, $n, p l$. [Lat, crassus, thick from the thickness of its leaves.] (Bot.) The Iuvseleek or stone crop fanily, an erder of plants, alliance liolales. Drao Polypetalons or monupetatous flowers, a many-leaved calyx, hypogynous petals, and follicular apocarpons fruit. They are succulent herbs or shrnbs with exstipulate leaves. The flowers are perfectly symmetrical, the sepals, petals, and carpels being equal in number (from 3 to 20 ), and the stamens being also equal to them, in the axis of fleslyy albumen. The $C$ are found in very dry situations in all parts of the world; a large onmber dry situations in all parts of the world; a large unmber ant, nod acrid properties characterize then, and have given a few sotte importance as medicinal plants. The genus Sedura is the most largely represented in North America,
Cras'ans, Lecies Licinses, a celebrated Roman orator, R. C. 140, who is introdaced by Cicero, in his treatise De Oratore, as the representative of that writer's own opioiovs on the sulject of oratory. We was unfortunate as a legislator, ibasonach as the law proposed by him, to compel all who were bot citizens to depart from home
wits math canse of the sucial War. Ile wis distin puished lor his love of the arts : and his mansion npon the Pahatinm is cited, both for its architecture and fir the stintnary and paintings with which it was adorned, as having been one of the must noteworthy in ancient Rome. He died B c. 91.
Cras'sis. Marcus hicivies, a celehrated Roman consul and trinurir, immensely rich and paswomately fond of montey, took part with sulla in the civil war. As preebr, in a.c. it, he was sont against the iosurgent gladihators under Sparticns, and thtally defeated them near Rheginm. The next year he was cuosul with Pompey. and made ant extraordinary dicplay of his wentth and hospitality. Pompey aud C. wire, however, personal
enennies, and it needed the powerful inflnence of (asar to effect a formal reconcilintion betwern them, which took place in B.c. 60, the first trinmairite heing then formed. Consul again five years later. C. had syria for his province, and matle war on the Parthitns. He wis defeated by them with immense slanghter, and was put to death, B. c. 53. It is snid that Orodin, king of Parthin, had melted gold poured into the rlead mouth, with the tannt "Sate thyself now with that metisl, of which io life thon wert so greedy.

-Lave add witdow, may plead for anuple credence," - Shaka

- That which gires a elainit to credit, belief, or confidence. "Alter they bad delivered to the kiog their letters of cred
thicy were led to ectauber richils furaished." - Hayward. (ECY.) A suatl tathe near the atar, or commanion talle, on which the bread unil wine to be used in the celebration of the Lords supper are placed, previons to consecration. They wree enmuon in the carly churches. The name is asid to the derived from the practice in ancient courts of haviag a sidebiari or credenci-tahle, at which the cup-bearere sud carsers (credentiarii) were sented to the raonarch, in ense of poison. Creden'dimm, it. : pl. Cabuexp ! [Lat.]
Credenamm,
thorizan beliel:
"Tacse \#ere the great artictes and crade ade or Cbristinsity
Sourn.
Cre'dent, $a$. Believing: easy of lvelief. (b.) Shat

Inving credit; reliahle ; mut to loe questioneri. Crealea'tial, a. Entitling to eredit; us, a credential斤. That which gives a titl. to credit; the warrant ujou which belief or atuthority is claimed
pl. Writings, testinomials, or letters, whuwar that is entutled to eredit, or is Huvested with mothetaty ; usually applaed to the instrumeats ur letters which an hithinssidar or other diplomatic numster receates fron his owu govermand, to herent which thofite his puwers and show to what rink of minister be is intembed to betong. Hences the
 tents beforc lajigg ultuittel to his first amdence.
Crealibility, n. [Fr. crichbilité] Credablebeas; stato ©redibla, $a$. [Er.; Lat, credibilis, froun credus] That maty be beheved; worthy of credit or of bulief; having a clain to eredit; ns, u credible witnes.
"Upun the cestimony of credibte persous, I um tree from donbt
Creal ibleuess, $n$. State or quality of being credible Wurthanss of belief; juat clain to etedit or belief. Crealibly, ado. In a credible or nuthoritative matuner or truet repused; reliauce on testiusony; belied; fuith trust ; coutideuce.
Reputation ; good opinion; name; character : estem thener derived trom the confidence of others: as, public credit.

Shall walk the morld in credid to bis grave." - Pope. (Con.) keputation for pecuoiary worth, which en tithes an math to be trusted, as, my eredit is good. (Book-kerping.) The side of an account or cash-book, in which a credit is entered; also meney or convertible securities pussessedur due; as, a payment placed to one -

The credr or popular esteem.
Polit. Econ.) The lending of wealth, or of the means of iwquiring wealth, by one indivilunl or set of individBats ou another. The party who lenda is said to give may be defined to be the acquisition by we party of tho wealth of soother io loan, according to contitions vu antarily agreed on between them. Very exargerated notions are commanly entertained of the influences of $C:$ but, in fact, all operations in which $C$ : is given or acquired, resolve themselves into a new distribution of wealth already in existence. The magicul effect that every oow and theo ascribed to $C$, 18 due to the tact that by the confidence implied in the giving ©., capital bere tofore dormant or inperfectly prodective becrunes fctive or productive. A party who purchases goods payable
at sume future date, obviously ucquires the comamand at sume iuture date, obviously ucquires the comman their value umputa to, in the same wuy that a part who has a bill disconuted acquires the conmand of a cor respondiar purtion of the capital of the disconnter Wealth is not created by the jssue of bills; aull all that their negotiatiog does, is to trunsfer already existing property from one individual or party to another ; or, to exlibit the fact in a still more simple form, the $C$ given by A to B is an asset of A and a liability of B . To confoumil $C$. with wealth, is to confunaid the
g.thization of society with society it self.

Public C. is the phrase used in express the trunt or coufidence placed in the State, by those who lend money Creal'it, r. $a$. To believe: to confide iu the truth of; as to credil the belief of our's senses

## Aod partly credik things thut do preange." - Shake.

(Com.) To euter upon the credit side of an account as crecliting cash received, - To set to the crodit
Cred'isable, $a$. Reputable; that may he enjoyed excreised with reputation or esternt ; estimable ; as,
Creditableness. n. Quality of being creditable
Credilably, udv. Reputably; with credit; without
Credii Foneier, ( 2 ratiode fon $(g)^{\prime}$ se-a, ) n. [Fr., eredit on lands. A system of borrowing money on the security of landed property, repayment to he mable hy instal period, was first established in France ia Is52. The $\mathcal{C}: \boldsymbol{P}$. is, on the grneral hyputhesis of prulence in advances, of yreat public benefit. It is susceptible of many modifications, and has already found very nseful applications

$-r$. ( $Z n, 0$.$) A crocodile; ove of the rrocodile family.$
Crocodil'idie, n. pl. (Zoül.) The Crocodile fumily order Suaria, comprises the Crocudile of the Nile, the Gavial of the Ganges, and the Alligators of America. The crocodile is the largeet of the lizard tribe. Thia formidable animal usually measures from 18 to 30 feet the tail alooe being from 5 to if feet in length; the body is rough and covered with tbick scales, bo hard as to be impenetrable to pistol or numsket-shot; the head is large, eod the stretch or gap of jow greater than that row of sharp-pointed teeth. The crocodile has four feet which are welled, the aterior ones basing 5 four while the hind feet have only 3 , the internal one alone on each foot being guarded with a mail. The crocodile is only vulberable throngh his eyes, which are remarkably small, abd his belly, which is undefended by ecales, This reptile is gregarious, sud on hot days great bnmbers bask together oo the sandy banks of their native rivers. The febuale laye sumie hundreds of egge, whirh she deposite loosely in the ground to he hatched by the heat of the sun: they sre of the size and appearance of the eges of a goose, and fortunately fall a prey to many indulging extebsively in the luxnry of crocodiles ${ }^{\circ}$ gies which they regard as a great delicacy. The Alligatur (see fig. $8_{7}^{7}$ ) has the minzle broad, obinse, ado greatly resentliag that of the pike. The teeth are unequal, the fourth lower ones largest, and eatering into holes in the upper jaw, snd the toes asmi-palonate. It is very voracions, devouriog all kiads of exidial suletances, and is particslarly attracted by fish, dogo, ducke, or other snimale in motion. It is found fron the Carolions to Paraguay.
-n. (Lugic.) A sophistical argument.- Ogilvie.

Crom Weli, Oinver, Lord Protector of Enolind, b. geased of is baronetcy, and his mother hemg a danphter of Sir Richanl Stuart, efforts have often luen made to show th thewais connected with the royal fanily. Little or nothing is known of his youth, and all the histories of his wild life abhat this time seemb to have leen greatly ex aggerated by the Ruyalist party. When 21 years bld he married Elizabeth, tho daugliter of Sir Thonas Bonrchier of the higher clazs of conntry gentlemen. Though he had boen electel to the brief parliament of 1628 , it was nut till 1640 th it he was known in the Honse of Com mas, and Sir Pailip Wrwick, who of sersed ins "Hi apparel," be sail,, "was very ordinary, for it was a plain cloth siit, which seemed to have been made by an all country tailor. His stature was of good size: his sword stuck close to his side; Lis conntenance swolleannd rod-
dish. his voice sharp anil matnonble, and his eloguence dish, his voice sharp anis mitnonble, and his eloquence
full of fervor." Tie hall been for some years est.sblishing an influeace with the Puritan party, who frequented bin house and bowed to his strong judgment. He showed Parlizment, but it was not until the Parliament raised a military force, to whicis he brought a troop of horse a military force, to whicis he bronght a troop of horke,
that his powery of orginization and command were fully developed. He speedily rose to authority as lientenant genersl of tho horse; and when he was specially ex empted from the self-denying ordinance, so that he could both deliberate in parliament and hold command. he became the most powerfinl man in the conntry. De show d his eminent sagacity in reconstructing the armyand infusing into it high apirit alone with stern disciplioe. At the hattle of Naselvv, in 1645, it was seen, in the signal deatroction bromght on the well-officered royal army, how effectnally he conld strike with the
weanon he had eonstructed. His military phlicy thronghWeanon he had constructed. His military phlicy throngh-

be narrated with enfficient distinctuess withont mach detail. In 1649 he condncted an exterminating war in Ireland, instigated by the ferocions principle that whint ever haman being opposed him should be put to death. In Scotland, where he saw there were nore suitable rather a pacificator than an oupressor. It was on the 16th of Decomber, 1653 , that be took the title of Lord Irutector, and became virtually king of Britain, and a king who submitted to very little constitntional re straint. ILow far he was sincere in the religious convictions by which he professed to be led, has been nintter of endlees deliate: and us a secret buried with him who mione possussed it, it may occupy controvergy to the
enil of time. That be was under powerful religious imcod of time. That be was under powerful religione im-
pulses cannot he doulited - the qucstion arikes as to the pulses cannot he doulited - the qucstion arises as to the
extent to which he really believed that by their power alone, and by no promptiogs of worldlinese, he wa driven ou in his ammitious edrecr. lie whs an emight hird task he had undertaken, by sharp decisive means kecping down plotting Royalints, jealons Presbyterians and intractable Levellers; and by a magoanimons foreign policy, leaving Eogland greater and more honored tham he had found her. He did not succeed with his parliaments, and had to rule mostly without them. At last care, snxicty, and growing perpiexities woro him out he became cloomy and suspiciuns, was overwhelmed by sorrow at the death of his favorite daughter, Elizabeth, Lady Claypole; fell sick, and died abont a month after Dunkar and Worenster. He was interred in the chapel of Henry ViI, at Westminster: hot the boty was turn from its resting place at the lestoration, expowed at Tyburn, with those of Brndshaw anal Ireton, the head cit off, and the remains buricd under the gallows, C. bad appointed his eldest son, Richand, to succerd him; bnt the reins of government were not to be heln by one so to dissolve the parliament, he nbdicatel, April 22, 1659. and ended his days in tranquil secluzion at Cheshant, in Hertornstire, in 1712. His brothe HFNEX, wose uphim many friends, also retirel to private life, and died in 1671 -The most importunt contribution to the his tory of this preat muin yet mado is the Lefters oand Speeches of Oliver Cromweil, by Thsmas Carlyle. Other valuable works are Gnizot's Lims of Oliver and Richard Cromwell, and the Life of Oliver Cromuell, by Jobn Forster.
Crom'well, Thom4a, FIRL of Eseex, chief minister to Heory VIII., B, alont 1490 . He was the son of a blacksmith, appars to have served in the Italian wars for a
time, and on his return to England entered the service of Cardinal Wolsey, won his esteem, and was faithful to him in his dicgrace, Ifc then eutered the kimg ser offices of state. pl. (Printing.) Hooks or brackets inclosing words ${ }^{\text {thas }}$ (Portif.) A break in the glacis belonging to a covered (Mit.) Formation of troops in an order parallel to the line of battle.

## CROW

-that clanacter, in fact, which has given to the disease the populitr natine which it bears. The congh, at first dry, is alfer s time attended by a thick, ropy expecturation, which, clinging line glue to the fatoces, and ex-
tremely diffeait to renove, casoses the cliid kreat suf tremely diffeuit to renuve, casases the elvild great suf-
fering to expel, the patient sppearing half suffocated io fering to expel, the patient appearing half softocated io
its abortive attempts to vond the adhering whitioh phlega. With these eymptoms come on thirst, heat, and considerable fever; the polse is quick aod vilurat to arch the neek buck in a manner most distressing to withecs; till, the anxiety of countenaoce and diffichity of raspination increasing, the little patient expires about the third day, strungulated from the interruption of air to the lungs. The parox ysus of this disease nenally
come on in the evening, nod becume iotensified about come on in the evening, nisd becume ioteosined about miduight, the patient semining freer nind better during the
diy. A fuerable termination nay be expected when the expecturation is free from the first, the breathing httle interffered with. and the febrile symptoms sigin and difficulty of breathing are gieat, the metallic found more acute, atul there is nu appearatice of expectoration That parente may sec the necessity of attending to this fital diseaso mimardiately, and better onderotind the object tor whith tife ditlerent remedies are given, we parpose explinining the peculiar morbid action which tikes phace in $c$, and the renson Why it is so rapid in its
comse, and often so futal in its termioation. $C$. is an inflammation of that d-licate membinane which, conthued from the month. lines the whole ioper surface of tho larymz unul windpipe, und finally of the bronchial tubes, or nir-pussiges. Though the ioflammation may extend from the larynx to the bronchi, the mischief is, in general, confioed to that portion of the membrane lining the triwhea, or windpipe. The consequence of this influramation is to induce the vessele of the membrune to throw ont a thick, tough secretion, to protect
the etracture from the action set ap. This efurpu, in the etracture fromp the action set ap. This effusion, in
character tithe a thin coat of gelatine. and called protescharicter like a thin cost of gelatine, and called professionally the aurentitious or false membrone, it sprewi not
ainng the whole circumference of the tricheal tube. This sheath within therence of the tracheal tube breathing moch mom ditficalt and oppressive would atill mit of itself prove fatal to the fonction of breathing, but the adventitions membrane possesses this pecnliar charucter, that as soon as the whole passage has heen lined, the membrane closes either above or below, and Hike the finger of a glove dropped down tho tube, ciffect nally cuts off all access of air to the lunge, thas accoant
itry for those efforts of the child, lyy striightening the ithe for thode cflorts of the child, hy stringhteming tho
throat und arching the neck, to overcons an impediment, that, once completely formed, terninates its life. It is to inctuce the re-absorption of thie false membrame, be expelled, that all the efforts of the physician are tit to hence the impurtance of nsing enerky end dispatch in the treatment. In wo rabid and fatal a disease, medical nivice onght to le immediately obtained. Bleculing, ex cept by leeches, is not now generally approved of by
nudical men; ; wime reconmend othere upium nod calomet. Warm bathing, or spongin Nen wirm water, ehoeld be had recourse to, as well as the inluhation of a watery vipor. The following ex

Let him have your custom, but not your votes." - Addinon.
(Physiol.) Cu-tom differs from habit, with which it is usuably compled. in being a froguent repectition of the
same aict, wherons hathit is the phint which such cuatom pronluces whou the mind or Inenty. Custon is wall sain to
 tionsand capacities altogether different from thase he was lorn with. Acts that arent first most disagreeable to us, or are only accomplished with the nthost difficulty, become, ly eacls repeated net, toore ensy atmi pleasamt until at longth it may he diftioult, or even impussible: for us to relraill from deang them. Physiologists tell as that evrry met of the boty - nay, even exery thonght of the mint, destroys it cestain portion of the matter of our body : but, ly that very net of dextruction, an ithcreased energy ne vitatity is communicated to the part, a barger quantity of fresh matter is attracteql to the part and by this means an increased store of materials is luit up for future use. By this moans the nrm of the blacksmith acyuires strength; the foot of tha dancer, and the hand of the musiciat, their dexterity. The effect of custom is not eliscernible during the vivacity of youth : in midille ago it kains ground, and in old age it gen erns withont control. To introduce un active hathit, the mere repretition of acts is mut suthicient, without lesugth of times. The acts require to he separated from cach uther hy shat intervais of time, 14 order tosacquire their fall force; and the more regular and mitorm any pleasnres are strenzthened by custum, which in other casesnres bege familiarity and indifference, or even disgnst Custom blunts the eige of distribs and pain; yut the want of anything to which we have been long accustomed is a kind of torture. The power of custom is a haypy contrivance for our good. The mind grows fond was at first diffirnlt and thesgreeable, hecomes at length easy and pleasant ; so that even our employments come to le changrd into onr diversiuns. It thas ilso distribotes a corresponiting amonint of pleasire anong all ranks of life; for whi, it renders pleazant the laturs of the poor man, the pleararns of the rich man lose their quisite pleusures which wunh otherwise eegross the quind and withtraw it frum nuru important pnrsuits From a consideration of the effects of custom we can Eve the importance of that precept which the he athen philosupher Pythangas ix suid tulave given to his disciples, Optimum vita gronus elrgite nam corsurtudn facirt jurmiz-dessimum-" sedect that course of ife which is the best and custom will rend r it the most pleasant.
(Lavo.) Such a nasate as liy common consent and aniform practice has hecome the law of the place, or of the subject-matter to which it relates. It differs from prescription, which is personal, and is annexed to thu persen of the owner of a particular estate: while the other is local, and relatea to at particular district Tu ing pualities are riqui-ite: 1. Antiquity; i.e. that it shatl have licen usad as fir berk as timeof lecal memors that is, "for so longatime that the memory off man run beth not to the contrary , ". Continnanca withont in terraption. 3. Withont diapute. 4. It must he reashshle annl 5 . Certain. 6 Compulsory. 7. Customs mut be consistent with each other. Customs in derogation of the common haw minst be construed strictly.-Cus-
tomas (coultumes), in the law of France, were the laws

Felating both to movalim nowl inmovable property, pect-
 manty tom. Thstricts goverued by cartom, we

 mulntiex on their being impurted inth, of exjerted from,
a connery. They appatr to have bean cathed cuntums from lecing customary prymunts, or payments which had been in uno from time imuthurial. They seem to havo existed in exery commereial comutry. The truntle mad expense necessarily incurred by a governamist in mak tell to its sereking some me,ths of remaneration, and mone seemed no fatir and reasomble ate that it should fatl on the gaokls or veskels on whose lehalf they were incorved. As a large portion of the entire revenne of thin comintry is derived from the custom tintios, they nre of the ntmost importace to ort proaperty, whil there are amby impurtant ghestions connecter with thrm. The dutied nor, iuleci, in
 for then they uust hes extended over $n$ verat pumber of articlew, by which mans the expenge of collection is laracly increased, und the freedom of the truber mach interfered with. They shonll hee levied, ne mucht as powsible, ou witices that do hot constitnte newsomice uf life, or acecesories to manuftucturimi industry. Aodernto costom dutits mre among the least oljectiomalile of all Aaxes, as they interfere fittle with the aperations of the hanntacture or trader, in many comes anving thther as n jurntection to the formor, and are (ur at last call be) collected at a relatively mall expense. Up to the time of the rehellion theexpenaes of the general governument
were derived nlamat exclusively from Custons 'ins'anandble. a. [0. Fr. mustumable] uswal; euntuany; habitual. - linble to the bumon ; of the dutien callied customk. -1As'lanaiblemess. $n$. Frequency; habit; conformity

$$

The componnds of $C$ arc, howevef, generally obtained from the ferrocyanidu of putassiam, is bill formad hy her, such as hide, homif, ant horn wiste, witb two part on putash mul iron filugs. The mass, when coll, is al gested in water, which dissolves ont tho ferrocyanide of potassium. Ten patts of this salt, thistilleal with i partu of cil of ritriol, unt 5 or 6 parts of water, yidla hydre merenry, farmisles cyituide of merenry. This, on hein dried and heated in a retort, furnishes $C$. It is a colerless gax, with a peenliar penetratitug odor. It in phisunful purple flume if bredisel, ies in ono-fourth of its limith of water, in one-twenty-fifth of alcehol, and uny be subositted to a high tomperatare withont decomposition. It is casily liquefind by a pressure of 4 atmuspheres.
the lingud state it is colorless, limpid, am lighter than
 crystalline solid. C., which is in itself a compount rait cal, h.ts the property of unitug with varions elements form still more conplicated rulicals. Thus, with iromi
 cyanogen; with manguvse, mathgni-C.; with phatinom platime-C; with pulladinm, pallulio-C.; with iridinn iridio-C.; ant with copper, eupro-e; - which all br ing hydracile with logdrogen. The priticipal compoun ot $C$. is cyanic reid, composed of an equivalent of $C$, whi an equivalent of oxygen, which has beon described nudem
the liead of Cyanic $\boldsymbol{A}$ cid. It also forms fise other con the head of Cyanic Acid. It also forms pounds with oxyten, all of which possess precisely
same composition, but differ rematrhably in their prop erties. They are cyanoric, cyanilic, foloninarie, fo for atids, and a botly calfel cyametu. Descriptive headiors Wroperties will be found ubiter thenr respective forna with chtorine 3 compunuls, which huve all the same ultumate composition, hat differ materi,lly in their propurties. One of them is gaseous, another liquid, and the third solith With ixhbe and bromine it forms sold combimations with sulphar it furms a comporand radicat, sulpurey anogen ( sCy ), which, with hydregen, forms hydrosnl pho cyanic acid; with selenion a sinilar compound formed. The cyanidus of the alkalies and earms ruc solnble, thase of the heary metals mostly meuntile it water. Tbe roust impurtant of these is the cyanide of potassium, which is oftaned oy fier of potassium and ron crucibles parts of terrocyanide of potasaina ind of a yellow color, unt has given off the last hubble ir gass. This salt is mate io lange quantities for the nee of electrotypists and plotographers. The former use it as a solveat for gold and xilser ill electro-plating; the latte to renove the unnect indite of silver from the collonionplate. C' is prome to form donble salts with of potassinm, when nded to sulutions of the heivy metals, throws down a precjpitate. which is soln ble in an excess of the precipitatht, forming a dontio cyatoide of pota-sium und the oretal. These doulic cyanides are of two clazers, - hroee which arm cyult easily decomposed by hyirochloric actu, such as cyan of potassinm and silver: and those which are not su aod irun, of potissiam and colalt, and several others. The salts of the secont clasa ure lomkial upon liy chemists as contaioiny the metal united with the cyanogeth forming an organic mulical. This will, perbitps, he better understomal ly ennsilferitg the followina formula 1st class. - Double cyaninde of nickel and potassion

# SUPPLEMEENT TO 

## CABL

Cabbage, ( $\mathrm{hab}^{\prime} \mathrm{aj}_{\mathrm{j}}$ ) n. [Fr. caboclic; It. cappuccio, dumilit of capo, Lat. caput, herd.] (Hort.) The Bras. sica oterucea, of common culiwary calbage, $\pi$ sprcies of
the genns Brassica. The innumerable varieties arise fron difference of soil atd cultivation: nnd we atl the callange trike form hybrids, new varicties arecontimmally prodnced. This is effected by the bees, when different sorts are io flower at the same time. The pollen ad and teing depositell on the pistils of other sorts, impres pates the germen. Heace, only one variety of $C$ chund be in flower at the same time in any garden or field whuy we wish to keep the sort unadulterated; partichlarly if some sorts have expanded leaves, and others close heads. The diferent sorts of e. noust prized for the gardea are cliefty divided into the close-hearting and the spreabing. In order to have a regmar succes sion of the seed shond be sown at dincrent times from the beginnings of spring to the autumun. The carly will increase more prodnce larger aud firmer luads and will not go to sced till the next calsum. Car, weturilly ruisel first in a seed-bed: when they are inteuled for early prodace they are sown lefore winter, and proper strong plants may be bad early in spring, which planted out in April, will produce fine $C$. by July or August. Those which are raised on a large scale are Fenerally sown in March, and planted where they are to remain in June or July. When they have been pricked out from theseed-bed very young, anh alhwed to get to a guod size in a pieco of ground prepared fir the parpose, before being finally trancplanted in the filk, the success is orore certain, and it will well repay the additional troulle. These come to perfection in mathom, aod may kinds are so hardy that they will bear the sercrest Kinds are so hardy that they will bear the sercrest
frosts, and remain coverclol with snow for a considerable time withont damage. Such are the green curly-leaved $C$, which form no close head, lut cousist of epresaling leaves. $C$. nre sulject to a peculiar disense when $r e-$ peatedly planted in the same ground: the lottom of the stem eularkes, and the plant becomes sickly. This dixease is called clabling, and is occavioned by an iosect, which deyosits its cggs in the sulsatance of the stem where it joins the ruit; the organization of the plant is deranked, anl the $C$ never come to perfection. The ouly remedy frir this disense is to clange the eultivaproduces clubled pluts lut to trench it up well, aod expose it to the winter's frost in ridese; quick-lime honld the pnt on it, but no manure and other vegetaliles of a different class humbld be sown for two or three years.-ln Germany there is it large consmmption of the large white $C$ : in the form of the famons dish called sourr-htuat, in English saun-Krout, q. r.
(Mci.) C. are a hesi-producing vegetable, whether given to man or animals; for the latter, especially miket cowz, sheep, and oxen, they are considered anadmirable foud; io the tormer, when imperfectly cookel, and only partaken of rarely, they are apt to proluce fintulence; time, aul eaten thoroumhiy boiled and pressid. The bust way of cookine $C$, to deprive them of all the ingredients likely to uroduce flatulecoce and indigestion, is to dients likely to prodace fatmedece and indigestion, is Cloth surreptitiously tikea by a tailor or cutter-ont of arments. See Crambe.

Cab'bare Point, io Plorida, a precinct of Volusia
Cable, (käbl). n. [Fr. and Sp. cable; Ger kobel; Heb. and Ar. chrbel, a rope a cord from chabol, to tie or mak fast.] (Nout.) Originally, that which lastens or ficx which a vessel is held. Cables, until within s receni period, were nswally made of hemp, but of late years iron chains have come much into use. A hempen calle of twelve inches girth, and lengtls 120 fathons, weighs 3,075 Hus. Since the weights of two cables of equal lengths will he as their sections, or squares of the girths, it is easy to dellace the fullowing rule for the weipht of any bempen cable : nultiply the square of the girth in inchee by 21.3 (or 21 is near enolgh); the prodnct is tha weight in lhs. Since, elso, as the briaking strain, or
resistance against the force to part the calic, will be as the sectim, it will lie as the weight, and whll he frund nearly by dividing the weiahts in Jhs. ly 100; the quotient is the braviog strain in tons. This rule is of conrse liable to preat uncertainty from the quality or wear of the calle. Chain calbes possess great alvantages over hempen cables; they are not liable to be de-
etroyed by chating on rocky grounds, nor to becoute
rotfen and insecure from alternate exposine to the atr
and water: nad ly remsun of thair greater weight, the atrain is exertect on the calle rather than on the ship

Fig. 460. - chaty and hemp cables.
In order that the ship may be eaabled to let slip her cabe in cage of necessity, chan cahles are farnisuto with bolts at distances from each other of a sathom or twu Which can be readily withdrawh. Calleo-Iprinting. (Manf.) The art of impressing cotton in desurilun mige fires ho one or in its witest sonse, as signifriug pintime on nuy fahrio whether cotton, wonllon, or silk. There are few dye which of themsedves will impart to cotton a brillinen coior, able to resixt the turtons of light and washing The aye must bi combution with $\pi$ sulstance called mordunt, which has ant itmity both for the dye ant the cotton filore. These sul stances, Althongh gencrally colorless, lave the property of chanpilig the culor of the dye. Thas, if u piece of cotton cloth lie inupressed in toots, and with a mixture of the two etate uf ron will hecone parmancutly impressed with reti lines black tots, aud cluwolate circlow The prowese of print ing in differcut colors by mpans of purdunts in vary ancient, leiog describul biy Pliny as lavins luew prim tised in his day in Erypt. In his Natural Ihstory, lie koburs amp relly are painted in Eqypt in a won derful way, being first imblued, not with dyes, hut with dye-absurbing druge, by which they appear to be nnal tered, lont when plamed into a califon of loiling dyestuff, it is chrious to see many colore imparted to the mole, in conseguence of the modifying agency of the excipient drug." In India, the modern method of memorisl, the process employed beine that of paintins the desich upho the faloric hy hand with melted wax Mady of the specioures of Iodian calico-ptiating by this method are most intricnte in their design, ind mum bare taken a lifetime to execnte. The procesme em ployed in calico-printing are :- Singring, by which the cloth is dennded of its fibous down, which winld prevent the perfect application of the dyestnff. It is effecten in tho ways: either by mipidy passing the cotton cloth over a red-hot iron, or by passing it over a serie of kas-flamee, which aresucked through the atbric by bnction-tribes juced ower them. Hine lye of sext bleached by beilg hoited in ao ankatine lye of sonda of
 once, more rinsed, dried, and smoothed. The cloth is now realy for printing, bering lirilliantly white, nnd capalie of receiving dyes of the brichtest snd purent colors. Calicoes are prioted in four ways:- by emal wooden blocks worked by hand, by large wooden block *orked ly a machine, by copper phater, and hy copper cylinters. The first and third methotis are uhost oh solete; the second is juractised juincipally in Frame and the fourth is the English methot. In the large blocks mentionel in the recond methonl, the patterns are generally mate of sycamure laid nuon deal, and either engravel in relief, of furmed ly epper slips, of different shapes, being drisen into the surfice. The machine uscd in this style is termed a Perration, frum the name of its inventur, N. Permot, of Romen. Thie different colural blowk are bronght dema on it sneceso bively. By this jrocuss, une man and three childiven ant print thirty picees of cloth in a day. In the Eng fish process, the ןrattern is indprested non copper ey inders ly hard stuel rollers called dies. Thuse cytinders are monated upin strong iron slafts, upon tho end of which is a tuothed wheel, ly means nf which motion is cumbmaicated to thens. Severat of these engravch cymors, hre sum calm, are nation one mullines. Thu cotton cloth is made into 1 continus well or furty or fifty pieces, and is dran on over the rolwels of cach one receiving its color froma a cylindur cotereil with woollen cloth, and rivolving in an ohlong trough of coloring matter, bordant, or resist-paste, and transferring it to the cloth. Calico-printingx have reached such a state of perfection that they will print nearly ten miles of cloth per day, with a pattern containirig fonr of fixe colors. Dyestnffs are of two kinda,
thuse which impart their color alone, and those which thuse which impart their color alone, and those which
requite the application of a mordant. The former are

## 698

## CALI

## CALI <br> SUPPLEMENT.

called *ubstantive, the latter adjective. There are, principally, five styles of calico-priating.- The Fust-
colur, or chiatz style, in which the patterin is applied in the form of a mordant, the cloth being afterwarda passed thrutgh a dye-bath. The color, if cumpse, clings only to the gordanted portion, the reat being washed ont in an after-process. 2. The Rongeant ntyle, 11 which some chersical sabstance which diocharges purtions of the maiform color in which the eloth was first printed. 3. The R-sict-paste style, when the pattern is printed is aome substance which resists the-general dye aftel harilo
applind to it, such an indigo or sone other substantive appli-d to it, such as indigo or some other substantive dint and dye is primted on the cloth, the unish of the two being effected by subjecting it to the action of tin spiriés, or chloride of tin, is used. Patterns jrinted tin sparid, or chardac of that, In the first stile the mordant used may le either ace tatio of ulumina, or red liquor; acentate of iron, or iron liqnor: or chloride of tin, or tin rpurite. The mordant is mixed with starch or British gues, and different shades of the satne color may he olitamed by silating it nure or lest. The princijnat dyes usid in thas style are logwinh, Brazil-woud, jeach-wood, Perbint herries, and gaths. (The differeot colors ohtained thy the conifound fully described under Breino, in the lualy of this work.) IIt the romyeant, or dias-hargestyle, the liwharge generally consists of some stronk acid, sheth is nitric oxalic, or curtaric arid, male into a paste with pipeclay gam, amil applied either to the uyen or mordin plivel along with the dixcharge, in w hich case a colured with red lime and whate huts mas b. produced by pass ing the choth throngh weak irun-lighor, and printugg the lined with real-liquar mordant. The dots are thell
printed with a disclarge-paste of tartaric oxalic acid, printed with a disclarde-paste of tartanic oxatic acid,
and the whate is pased thrmigh a nadder dye-vat. In and the whole is passed thrumgh a madder dye-vat. In
the renist, or reserve style, various suleytances capulie of reniatiang the artion of sulnatative dyed are ninct shch as oils, metallic oxides, nad their salts; and rebupression is thesired. The hatter method of printing with moridant refists is callod the lapis-lazufi etyle why, it is lard to naty. Stesim colors are mostly proor perchloride of tin is ued an a morslant. A tull-bodice rem. for instance, is promberd in the folluwing manuer: A decuction of pruch-winal is thithened with chloride of tin. The impression is printed un the eloth with
this onixture, and, whan dry, the gends are subaitted
 subatancmantaiaml in the slyestaff. Spirit colors ar brillamt lut very fugitive. Thily are mostly vigetable is terucul. A sixths ats la, pigment-prinfing, is when a heary insolnble color, surh as uliranamine or nas genta, is mixed with guttarperilus solntion, alhnmen, or caseia, and printed on the eluth. Since flye intridnction of the milimu dyw, this method of printing
has nomewhat rivived. Thene culors now canatitute the largent and must impertant mertion of steata-fix dyombin materiale, nail in thear belmivior and method or jrimting they furim a chas liy themeivers. Tha range of uninue colurs now enharaces almust every possinh

Calorimetry, (kül-n-rin
metrom, mensore.] (Phys.) The thermometer indicate relative. not alsolute amounts of heat, it shows the condition of a boly in regard to sensible heat, that is, the teniperature of tho ausorbed or enitenetrical meavo. Calorinetry is that branch of the science of heat which treats of the absolote measnrement of beat, and the instratuents emploged tor such deterbuaations are callied Calorimeter The existeuce of two such terDis as Thermonetry and Culormetry, in the eame science, is undoubtenly unfurtunate, because as far as their denvation is concerned. they might both apply to the same classes of phechomema. The thernoneter was invented nod uamed berore calorimetry had bect eren thought of, and wheterm latter came to be practised, it was thomgt thent. could which did not express aplied to deterninations of absowith any jastice hepphed the only convenient ternm remainug was calorimetry. It would be preferable to a thermoneter, bot it is unlikely that the later term, frou its conparative antiquity, will ever ccase to be nsed in its present form. For the exact measuremen of heat three forms of thermal unit are enifloyed: wit, the amount of beat necesazry to raise 1ho of whe from $32^{\circ}$ to $33^{\circ} \mathbf{F}$. ; or the water from io to $1^{\circ} \mathrm{C}$.; or agan, tie Freach nuit or Culnrie, viz, the amonot of heat necessary to ruise kilogramme of water frum or given ont liy sulstances gnactity of heat absortsid or given of tomplerature combpared with that alsorbed or gives unt ly water under similar cotudtions ts called mespols by which specific heat is determined, in other words, the various processes of calornuetry. Thrue priacipal methods are cm ployed for the determination of sprificic heat. In the plirst the heat is measared by the abommt of iee which it melts; is the second, known as the mond nf mixtures, boulice of different temperatirres are mixed with water, and the Leat calculated troun chat one the leat is ture; and in the thiri, or methme whicl a booly requircs o coul. - 1. Determination of specific Heat by Pusion of 1ce. The first aod rudest form of calorimeter was hlock of ice rontaining a cavity cosered exansined, at known temp rature, was placel in the cavty, and when it had cooled down to the tempenture of the snrronnd-

Ceglie. (ckel'ya,) a town of S. Italy, prov. Lecce, 18 m . Cel'inloial, $n$. (Chen.) A trude name given to the peculiar substaoce discovered in 1870. It is practically a homogeneons form of cellulose ( $q$. v. page 510 ), the basis of almost all vegetable falrics. Cellolose is insolnobe, but by treating it with nitric acid it undergoes a chemual cbange, a purtion of the nitrogen uniting with it and forming a tody known as nitro-celluluse, or cunform, bisulphide of cathon, and varions other snbstances. Gun-cutton dissolved in alcohol and ether is well known, being theo called collodion or liquid adhesive plaster. "In this form it is employed in the "wet-plate process " of photography, being there used as an organic
transparent ioalterable film coating a plate of glase and trunsparent iaalterable film couting a plate of glase and alliering firmly to it, and yet capable of ahoorbing the
chemical salts, whose properties render photography chemical salts, whose properties render photugtaphy
possible. The attempt to procure commercially any possible. The attempt to procure commercially any
nscful product by means of liquid solvents were failures until it was discovered by the Messry. Hyatt, of Alhnny, N. Y., is 1870 , that gun-cotton was solntle in melted gum-camphor, and produced a body miform in struetare, sulid at all ordinary temperatures, and haviag
mont remarkuhle propertips. Thix promluct they patented under the nams of celluhold. In practice mos, phre
 heing merely to take up the water. The juper fo cons hetted ly the nitric ucid! inte nitruecullulose. It is cantionsly dridd to trove it from all almixtures. It is then tround sith compleor and a snall abount of Fimally it is hented to the tenusebature at which the complare melts and worked thetween hot rollens, when the nitroncelluluse is disoblsed and the rmalting product is cellubid. The cellohat is luraided by the makem to the subsinliury compuniza in shecte, roods or tulpes The wantig. co. confius itealf strictly to the proulas tion of the crube materin, hot licemes the socerial companise to mambacture this crade material hion the chasive right to manaforture its una spochalty in the Corited States. Thins the finmo-kry company manufice tures thething bat pinue-heres, und sin uith the uther cos C: as furnished is a tough, modesately hand, sory clantic

Censises The Ninth Census of the Vnited Status. menced on the lst June, IS70, und substantially compheted hy the 9th Jian., |sit was the mont complete and comprehensive standical report which had yet lewn
furmslod to the national archives, ant one too which is, in matuy pectes, sujerion even alvanced of Earopasan conntries, Thoroagh in all its bearings and details, it kuplulies at a ghane, as it
were, all that is requixite to be known, statinticully gramang, of the prosint condition and resonares of the United Statess at large, and athords a companative lans from which deductions may be drawn for furcanting its prugressive furure. The sthedutes of Pupalation elalmately number the honses, specify the fanilics, protession or ocenpation of every inhultitunt. distinEuishiog the marriell and widuwed, those attouling shbosh, and those wholly illiterate, the cleaf and dumb, blind, insane, idiotic, papuers, and criminals. Statistica of mortality are inclmiled, piring the name, age, sucx,
color, civil contition, bilthilace, ocenpution, and canse of death of ench freson who dhen within the year previons to the day of cnumeration. The comparative gain or luss per cent, of each State and Territory during the decade of 1 sfse- 70 je also given, and is of specinl interest they affectell the ratio of promatation. The tahles devoted to Agriculture present the munher of firmas in each County. State, und Territory; mumber of arres of hand in farms, impured, unimprovel, moder timber chinery; total atoonm of wages praid during the year immetiately preceding the taking of the Census, incluting value of borrd of servants; tutal extimated value of all farm prothets, tucluding hrtterments nad ndditions to atock; total ditto of mrehard, manket gar-
den and fureat prombets, and of home manuluctures den and furent prablacts, and of home munaluctures;
value of all live-nturk, sind of all nomimals mlanglitered, or solil for slanghter; enman-ration ly Counties, States, and Turrituries of ali varieties and kinds of nad stork, ant also of farm crups und proulacts of the soil. 'That portion devoted to Fixeal and Fimancind mattera, exlubita, hy Stutes, Turrituries, and Countins, the totnl real entate and jersonal estite; trine valuation of real and persomal evtate. Tutal unambt ot laxation (nat national), and the same distribnted in its aplicuation to State, County, and Municipul oljects, Tofal puldic delit (not mational), distributed in a like manner, nnd
specifying whether bonded or the reverse. The Edaepecifying whether bonded or the reverse. The Edaof colleges, academies, schools, churches, \&c.; also those of mines, manoufictures, aud fisheries, specitying the capital anvested, the quantity, kind, aad value of raw material ased; the motive power, number of hands of products, in quantaty, kind, and valne.-The Tenth U. S. Census, taken in dune, $1 \times 81$, is unch fuller than
that of $1 \times 70$, and is the must thomonsh statistical work that of $1 \times 70$, and is the mest thombsh statistical work ever nodertaken. It prosents, in all its branches, the
fnll story of the murvellons progress ncconplished in this conntry dining the last decade. Werefer our re,ble sus, to the artitile sual cnt tu be fonnd on pase 2429 of estinis fucts otheruisu puls attainableby muny miterof a vast amonnt of figures.

## hloralnan. (

 minina. (Chem.) The name under whith Prof. Gammininm, as an antiseptic nod disinfectant te of alustated by him, as futint es chaloride of zince or cark, an acid, and at the same time nun-prisonons, and free from any mapleasant smell whutever it may be prenared by mixing solntions of sulphate of alumias and chloride of calciam, both of them cheap commercial products. In this operation sulphate of line is precipitated, while the hydrochloride remains dissolved. This may be evaporated at a pentle heat, crystals forming on cooling. According to Prof. Gamgee, by its use as as antiseptic, raw-hide, meat, and other bnimul substances, itnmersed in a solution of 1.040 to 1.040 specific gravity, will he preserved parfectly for an indefinite period of time, and, by insects after beine removed from the sulation slightly tainted, when imiaersed, recovers its freihness of appearance, and becomes firm and falatable. In solae instances, fresh fish, such as palmon, when canght, were dipped in the solution, and, after a passage of several days, without ice, to London, in the sumbur season. were funsil to lee eatirely eatable. This substance is snggested as an aidin drying cod on the const of New foundland and elsewhere, as therehy an immenso mass of fish that are now rejected conld be reisdily preserved. The offal of cod and mackerel fisheries, which is now thrown overloard. conld be preserved by this snbstance as long ns might be required, aad then carried ons forms of fish gatedo. For disinfecting of the varisolntion varying from $1+006$ to $1-010$ is sufliciently strong to answer the desired ohject, stronger bulutions being usmally unnecessary and imparting a disakremtile smell. The solitl matter of sewage is said to be precipifated more rapidly by this enbstance than by the use of the persalt of iron, and the odor disappears eatirely. T te use of chloralum in any epidemic, the cattle plague, or other contagions disense, incinding the epizootics, is indicatcd by the anthor of the commanication. Finally, is recommenticd for the treatment of wounds, eryeijelas, gangrene, and varions conitagious and inflamnatory mereing the limen of preicnta ber the purpase of immereing the limen of patients before removing it from it is said to have no equal in ony of the preperation hitherto recommended, and lias also the mivantage over eardy atl the rist of lieing free froot any uffensive ofiner hloromethyl. (klo-ro-miditil,) n. [From chloride and atethylene, (Cheni.) Accordng to a recout repori by Dr. Rossi, experiments instituted at the Uaiversity of Padua nuca the nse of bichluride of methyleoe as an tanasthetic showed that out of 108 operationa, in only eight was there any vomiting, and that in every respect this chloromethyl should bave tho preference over chloruform for surgical purposes, haviug for the that city. Toisonné, $n$. [Fr. cloizon, a partition.] A species of ware made in Japan. Upon the enrlace of the otgject,
generally copper, which is to be generally copper, waich to to be enamelled, the desigh
is worked of various lengths and shayes These are fistemed with strong give and form the closenow or fastened on which are to separate the different colured emancle . this rymuires grent care and skill. The design having been thas fixed, the enamels are introdnced between the cluisins, in the form of a dry paste, by means uf dimidntive chupsticky. The whole is then baked, after which the varions little cracks and crevices which aplear in the fused enamel are filled in with fresh puste, and the ardele again placed in the oven. In the snperior work face is noifurn ond with gain and gaim umin the surand luatrelers. The polishing io, home with yet rough isalong and tedions poprationg is done with a stone, tand in the case of articles of any size. The effect of the proceas is to grind down the inequalitics of the enamelled surface, until the design is left clear and indelible, ontlined hy the cloisons, and with a fine vitreous lustre. Fine examples of this ware are very expensive.

Coil. Primasary and Seeomalary:) (Phys.) Terms tion. The wire which trasmits the current from the battery - that is, the indneing wire-is called the primury coil. The secondiry conl is the circnit which the indaced current traverses. The primary coil is
made of pretty thick wire, and not very lang, in order made of pretty thick wire, and not very lang, in order
that the current from the laitery maty not be tho mnch that the current from the battery may not be too mnch weakened ly resistance. The secundary coil, on the
contrary, is made of the finest possible wire, and of great length, in order that a very large namber of turns of it muy be brought under the intuence of the primary ofil. The advantage gained hy incruasing the mumber of turos, aod getting them near to the coil is which the current is passing, far more than conterbalances the disadvantages arising from inereasiog the resistance. It is pecessary that the sereral turns of the
secondary coil should be very carefilly ionulated from each other, for the indaced electricity will otherwise leap across, instead of passing round each thrn wire. For this reason the wire, as it is coiled on,
with the layers of shell-lac or gitta-percha.
With the layers of shell-lac or gutta-percha.

incompressible. The experiment known as the Florenfiac Experiment was leftl to point to thin conctusion A hollow neetalic sholie saill to be of gold, and alsu of was submitted to great pressure. Siuce of all solids for the same surfice a sphere hins the greatest contents, it follows that if nothe if the water eecape, any fintern ing of the glotie must he attunded either by n dimint. tiun of the volume of the contained water, showing its comprecesing, or by at atretching of the aetal. It was
fompl that the wher was forced throngh the metal, spfombl that the water was forced throngh the metal, appearing an dow on the cutsule. This was viewed as at
prouf that tho water was incunpreseible. That water, morrury, and several other liquids are compressible athd their compreksion measmrable, was shown by Gr-
stedi. A greatur number of li, uids were examined lyy Collalun ind Sturds, with somewhat differedt results

## SUPPLEMENT

The apparatue used for measnring the compressibility of hiquids his bren named the piezometer. That showa io Fig. 2 is the form invented by Ersted, as impruved
by MM. Dhspreta mod Saigey; it consists of a stron by MM. Drspretz nod saigey; it consists of a strong glase cylinder with
very thick ides and very thick sides and
ant iaterasl diancter
of about $31 / 4$ inches. of about $31 / 4$ inches.
The base of the cyl-
innler is firmly cer moner is firmuly ce-
mented into a wooden foot, and on ite opper part is fitted clused by a caj which can be unscrewed. funsel, R, for iatro dueing water into the cylinder, and a ically elased by a piston, which is piston, wh
moved hy
p . in the P. In the ioside of is a glass veasel, a containing the liguad the be comprossed. The upper jart of this
nites mites in a capillary
tute, $u$ hich dipis noder mercury, 0 . This tube ham been
previoubly divided into parts of equal capreity, dot-rmined luw many of these contains. The latter finding the weight
 $P$, of tho murcury which the redervoir A contains, and the weight, $p$, of the murcory contaned it number of divissons, $n$, of the capillary tinbe. If N be the number of divisions of the p tile containeti in ralne of N is ohtaincl. There is further a manometer. This is a glase tube, B, contaising air, closed at one end, Hull the lower oxtremity of which dips under mercury. When there is no pressure on the water in the the water within the cylimpler is comprain; but when of the screw P, the presulare is trauemited to means cury, which rises in the tohe, compressing the fur which it contings. A groulmuted scale fixad on the silde of the tuhe shown the redaction of volume, and thas rednction of volume indacates the pressure exerted on the liquid in the cylindor. la making the experiment, the vesoel A is hilled with the lighid to be comprissed, and the end dippeti under the tur-rury. By meats of The finnof R , the cylinder is entirely filleal with water. The screw P being then turnell, the piaton nuves down-
wards, and the prensure cxertel uphn the wator is tranmitted to the mercury anal the air in conse promenswhich the turcory rises in the tube, $B$, and then in of cupillary tale. Thie ascemt of mercury in tho cimilliry tule shows that the liquil in the vessel A has dinif ished in volume, and gives the anonnt of jtas comprese ainn, for the capacity if the whole vessel A in terms of the grabluated havions on thos capillary tutho has been proviouly det-rminel. In hiv firet r-xperimenta, (Erthe namu, its andos heimg comprensed both internally and $\cdot x$ x.rmally by the liquid. But nathermationd umalyens prover that thin capacity dimintars in comerprence

Conservation of En'ergy. (Mech.) This prin ciple applies either to a machiue or body left to itself, of the different kinde of energy ins the that the sum total amount of eneray ie the noiverse, remaios alwayd the same. The foundation of this principle was lad by Newton in his Comments on the Third Lac of Notion but recent discoveries have raisel it to the position of the grandest of knowa physicul laws. The statenient of Newton Day be thus transhated:- "When energy is expended on any eystem of bodies, it has its eqnivalent ity if there be no scceleration. molecular forces, or stavity, if there be no acceleration; but if there be ac celeration, wart of the energy expeaded is spent in orerconing the resistance dne to the acceleration, and to the work so sjent." When part of the work done agaiost molecniar forces, as in bending an oring or against the force of gravity, su in lifting a weight, the recoil of the bpring sald the fall of the weight are capable at any time of reproducing the mergy origiasily expended. The kinctic eneray becomes putential. But in Newton's day it wam sulposed that the rnergy dent in overcoming friction was absolutely loat ; but Juule's investigations have proved that, in ull such cases, a quantity of heat is generated which is an exact And defiaite equivalent for the kinetic energy lost. it can beaccounted for in which energy is theveloped amount accounted for by the disupperarance of non equal ansount alsewhere. Hunce it is conchuted that is a part
of the universe could be bo ieshated that it could noilher receive energy from, nor give energy to, the nuither receive energy from, nor give energy to, the parta of
space external to it, then ite totnl amount of eaergy would remain unchnoged. Further, if we consider the motions of the molecules of matter which constitnte light, beat, magnetism, and clectricity, und the action of the furcey dne to chemical activity, as well as the motions and forces of which we are cognizant by direct observation, then we may state the law in ita noet uniyersal form-anmely, tint the total amouat of energy
in the aniverse ix the ssme Conatraction Company, anmme
onatraction Company, a nume applied in Wal otreet and anoug railruad upeculature to a stock com-
pany created for making the work of another company, or, is plain and truthfnl words, to a pestulent excreacence on the railroud system of the country, Which operates by buyiug a debt on the present for the future to pay, if it can. Let us suppose that a railroad company deeires to extend its line into a new and promising regiou; or that a company fe organized to build a now hiue. If the work ho dune honeatly, the corporation having the work in charge, eende put its engineers, gets its surveys made, makes up its estimates, and lets out the work to the contractors, to be done at the lowest price consistent with goud nork. Upon the estianates of the actual cost of the werk ns thue mande, the boads and stock are kold to pay for it. of course, the lighter this burden of dubt the better the road is off. Now, sinppose that the comipany which is to build the new line or extend an uld one, does not go honestly to work, but gete the job done liy a cunstruction company. The procedarn is then different. The actual cost of the work is ancertatated, the eane ns in the former cnee, but that is all. The clone circle of managing directore have organized themselves and a few favorite friends into a constructiun compuny. la their corporate capacity as constractinnints, they will construct the road; in their cajucity as directors, they npparent that it is to their hork turat to nuake the It ie us costly ns they dare to. Their to make the work anty nhow that tho rad will cont only $\$ 12,060$ per tuila An directors, they will lume bumle to the exterts any of $\$ 15,000$, or even $\$ 30,(0) 1$, per mile, and atuck in addition to this. The difference letwern the actual cont of tho work and thint nt which they, an directers, acretly contraet with themechion an a construction comspany to the it, ie their profit. The romb, ciunhed ly its othermors murven of pomited delit, blaty go imto lankruptcy withill two yours of if completion, but the conntructionints have purketed fiefr protite and got into public eotlce in thin country, war hat brought tho Lufan Pacitic Railway, unter the nerme with

'ore'a. This comparatively muknown country of N.E ore an. This comparatively muknown country of N.E. tary, bnt in reality an independent and powerful state has in pitite tate years asenmed a moro prominent part in history than she hud herctolore takeni The hrs uns an embroglio with the U. States in 186 a, In Oct. If that year an Americnn vessel, the Goneral Shermum, Isital (" for the osteusible purpose of entering into
rading relatious with the natives. The vesscl's truc haracter, however, is belicved to have been little other than juratsal. Nler advance up the linyang River beng unhused lyy the Corcans, bostilities enshem, ending in the tlestruction of the vessel and the sumbary execution of her cruw. Upin the news of the affirir reachng CLina, the U S, steamers Wachaselt sod Shenandoun oere sent to (. to make investikations, and, if need be, in surveying the river-ilpproaches to the interior, the Coreans mate a treacherous attack upon the two vessils. The American commander, besides decliaing fifts which were sulsequently sent him as peace-offrrings, demanded an apotagy from the government for the inwitt tu his flus, and on answer being returned withiu the ten days milntted for the reply, he at once proceeded to inflict chastivement upon the "barbarians." The esalt was the destruction of several of their forts, to sether with magazines and stores, and the sacrifice of sumte thires humifred Corean lives, besides a cust to the
Ammericans of i limutonat and three men killed aud Americans of a licutonaut and three men kalled and twelde Wonulded. The betond and more rucent event
concroning the fireizn relations of $C$ is in connection with dalan. In 1foy the Japanese invaded and overran the ennatr:, and compelien the Coreans to conclude a treaty of piate by which $f$ ? was declared a province of Japat, and bound to pay ber a certain yearly tribute besides bucuming Juparis ally in offequive anl detensive coucert with respect toattack made upan either comutry by uther juwris. For a number of years this treaty liuld gorn, lint the inrrawing strength of the Corman monfle, and thrir noalatell risolve to seek recovery of
their inilequintencs, lal, in course of time, to the cossution of the ampmal tritate, althongh withont furonal renubiation of the ternss of the treaty forced upun theth aplear that in 1sis the Corcans offered their aid to dapan for expelline the Ancricans from the coasts of the pan for experline the Ancrimank from the coasts of the fulp agatinet Erinela agerression in 1, a demand that wha altugether isnored. It followed that, imdygunt at thiw hastain evinemi by the dapanese to traty atipula-
 adoption of muny of the manar ra and costomat of civiligation, the Coreans imly neembdan oppertunity th throw off the dupmuse combertion altugether. Thize whe af forded theth when the. Miksule ofthially informul the and brnanded the lonk-tlelayed payureot of tribute
 and ao official communication addresew to the Mikado
declared the treaty roid, and threatened immedfate war. This thenment, publiohad in the Juparse Guzetto at thonkh Jupan lus not yet thas far taken ng the giantlet mo dethutly thrown duwn to hor, there can lie little donht that whe in hat haling hor time to engage in do-
terminal hostibities with termined hustilities with lier reftactury wornt, the
 Rome of the Jajntiwse emitassy. In is $\times 3$, the firnt cta busay froli Curea arrived in the l'nited Stati-s.

Crust of the Earth. (Geol.) That small portion of (omplatet which is accessible to luma ofservation. It comprises not merely thuse portiohs of hich the structure is haid opets in mountan precipices, or in cliffs overhangibg rivers or the sea, or whatever he miver may Jevcal martinciai cxcasations; but the we are that outer coveriag of the phate on which hear the surface. These reasoninms may extend to a depth of several miles, perhaps tea miles, but even then it masy be said that such a thickness is no more than the $\frac{1}{\text { part of the distance from the surface to the }}$ centre. The remark is just; but althourh the dimencentre. The remark is just; but although the dimencempared to the entire globe, yet thoy ure vast and of magnificent extent in relation to naan, and to the orgavic beings which people our globe, Referriog to this staudard of magnitude, the geologist may admire the ample limits of lifs domain, and admit, at the same time, that not ouly the exterior of the planet, but the entire earth is but an atom in the midst of the countless worlds survexed by the astronomer. Now the materials of this crust are not thrown together confosedly, bat distiuct mineral masses, called rocks, are fonud to of arringemont. The term rock is applied indifferently by geolugists to all these substances, whether they be sof or stooy. for clay and saod are included in the urm, and some have even bronght peat under this denomination. Our older writers endeavored to avoid offering such violence to our language, by speaking of all the component materials of the earth as consisting of rocks and soils. But there is often so insensible a passage from a soft and incolerent state to that of
stone, that geologists of all countries hase found it instone, that geologists of all countries have found it indispeusable to tave one techmical term to iactate both, and in this seuse we find roche applied io French

Cundurango, (kun-dw-räng'go.) (Bot.) The name given $n$ Eleatder to a platat found in the prov. of Loya, (Mkura guaro). In the epring of 1871 , the State De partmeet at Washington received, through the minister fom Enatior to the Uaited States, specimens of thio plant in order to secure proper exjeriments upon it on the part of the American facnlty, marvellons ynalities in curing cancer and other similar diseases being ascribed to it liy the physiciaus of Quito. Its virtues were first discoveref, occording to a communication accom panying the specousene, entirely by accident. An Indim had been suffering fearíully for a long time from by surturg his life by poisen. For this purpese she selectud the condurango; but, not Leing able to ohtaio it at the time of its fruit-hearing, slie made a decoction of the bark. To her astonishoient, the first application appeared to benefit the patient rather than otherwise and by a continnance of this remedy he was completely cured io a short time. Dr. Bliss, of Wasbington, claims to have actomplished several notablecures opon promitent personages by mrans of the cunduraugo, and considers it to be as relrable a specific in cancer nud scrofola, and ocher blood-diseases, as cinchona and its alkaloids bave proved to be in zymotic diseases. Much conthe plant, many physicians deoouncing the whol the plant, many physicians deoouncing the whote the Phartuaceatical Sucipty of London concludes, as the rusult of experimeuts, that the plint has very little practical value; these determiontions, however, being practical vidue; theze determiontions, howerer, being upou experiments with ioferior or spurious specimens 'ust'uinghau, to Missouri, a towuship of Chariton Cunitugham, in Tennessec, a district of Coffee Cubinitslasn, is Firginia, a township of Fluvanna ('un 1 inflnam's, in Georgix, a district of Jackson co.nuingham'o, in North Carolina, a twp. of Person

 pertanimg to, Dagnerre, the inventer of the daguerreoDasuerreosybe, wla-gairo-(ip.) n. [From Daguerre, 4. r, and tir. typos, mimuge ] ( Fine Arts.) A procese
by which images are impressed on a silver plate. A perfietly polished silver phate is exposed in the cturk to the vapors of iodine and bromine, ly which a mixturo of iodide and bromide of silver, exquinitely ernsitive to lighlt, is obtained. The phat is than exposed to the ac-
tion of the image formend Farsiur from a fuw secopils to mexoral minutes, according to the intenmity of the light. A latent muresaion is formest on the thin of bromo-iodite of silver. giving this substance the property of combitung $u$ ith the vapor of anrenry, in thuse parts where the light line struck. This latent impression is hrought ont or deredoped by
being expesed for a few seconds to the vapur of mercnry in a hented box. On withdrawing the phate, the mercury will bo fonud to lave tixud itself to the silver in ent portions of the image; the deposit beine white and brillingt on the lightest portions, more or leses pray on those parts constitating the half tones, nos absent
altogrether in the deep shadows. It is then washed with a weat solution of hyposulphite of sorla, which dinsolve ont the bromo-fodide of silver, that has remainel ntialtered by the light. The lust process consista in haying on $n$ fine film of metallic pold, by pobring over the plate a solution of the dunble hyposulphite of kotha and pold, or sel dor, us it is commonly called. Thero are few
guestions which hategiven rise to greater centroversies guestions which have civen rise to greater controversjes anong chemists, thum the nature of the $D$. innge, many
supposing it to lie nueremry only, others thinking that it is an analignor of mercury anif eilver. It is onfortunate that the quantity of material formed is so very minute, that it becomes impossible to sutject it to analynis. This curions and ingeaions precess has beet almost cotirely superseded by other photographic processes. - Sue Pbo-

Dan'iean, n . See Pbilipo
Damiel, (din'yel,) called Belteshazzar by the Chaldeans, a prophet descended from the roval family of David, who was carried captive to Bathlon, when very young, in the 4th year of Jehoiakim, king of Jodah, B.c. niah, Mishael, and A zariah, to reside at Nelonchadnuzzar's court, where he receired a snitable edncation and mowde great progrcss in all the sciences of the Chalde-
ans. At the end of therr three years educntion. D. nud his companions excedled all others, and received hooordisphyyd hiz prophetic gitso in interperetimg the drean of Aevochadnezzar, bs whom he wismade vasernor of Babylon, and hend of the leatenel and preestly class He- secms to haye becin abacut, perhaps on some for into the hery iornace. At il later period he interpreted mother drean of hebuchadnezzar, and alterwards the celebrated vision of Belshazzar - one of whose last works was to promute D. to anin uffice mbeh higher that be bud prevjensly held durimg his rephe. After the capture of Babylou by the Bledes and Yeraians, under
Cyaxares and Cyrus, D. was contiunad in all his high Cyuxares and Cyrus, D. was continued in all his high
employments, und enjoyed the favor of thesi prineos employments, und enjuyed the favor of thesi prinesg
until his desth, wexept at one short interval, when the antil his death, exemt at one short intervat, when that
envy of the other ofters prevailed on the hing to cast bin into the lions' den, wh act which recoiled on his foes to thar own destruction. Daring this proriod he earustly laborel, hy fasting and prayer as well as by hand, the promised time hasing come. (Dan, 9.) Ibe lived to see the decree issuct, ind many of his people
restored; but it is not known that hee ever revisited $\mathrm{J}^{-}$rusalen. His propbecies are written partly in Alebrew
and partiy in Clandee. They form the 2 th in order of the bouk's of the Olit Testament. This book, which bears his naue, is partly historical nnd partly prophecti cal. The first six chapters are hastorical, and speak of D. in ibu third person: the last six contain visions, Which D. relates in the first persom. in the first six cocurred in the reigns of Nubnchadnezzar, Buls whazan amd Darius: and, iu particular, the second chapter constains Nebuchadnezzar's prophetie dream concerning the four great succussire mumarchies, and the kingdom of the Messiah, which dream Gud eathled $D$. to interpret. In the hast six chapters we have a series of propbecies, revealed at dillerent times, and extending from the days of $D$. to the geberal resurrection. The Asyrian, the Persisn, the Grecian, and the Ruman en-
pires, are all porticnlarly deseribed noder appropriato pires, are all purticnlarly deseribed noder appropirite of them was to the divided into ten lesser kingume ; the time at which Christ was to appear is precibely fixed; the rise and fall of Antichrist, and the duration of his power, are exactiy duterminul; and the futare res orn mies, and the universal provalence of true religion, are distinctly foretuld as bejog to precede the consummation of all things. The book abounds with the most exalted sentiments of piety and devout gratitnde; itstyle is simple, clear, and conciso; aod many of its prophecies are delivered in ternas so plain and circumstan-
tial, that many have bern led to dony thirir anthenticity, and, that many have bern led to deny their anthenticity, taken place. Porphyry, who lived in the Bd centary aflirmed that the book was composed as recently as the tiose of Antiochus Epiphanes, and that therefore it narrated only past events : nnd he has bad many followers in pare recent times, and even at the present day. The arguments, however, advanced againot the anthenticity or genuineness of the book are tou trivolous to provail against the testimuny of Clarist hiopself, when he says, "When ye, therefore, shall see tho abomination of desolation, spoken of by Damiel the prophet,
stand in the holy place," \&c. (Mati, xxiv. 15.) stand in the holy place, d.c. (Matt. xxiv. 15.)
Daniel, the 2 d son of David, (also called Cmaba,) a descendant of lthamar, the tha soo of Aaron, was one of the chiefs who necompanied Ezra from Babylon to Danie

Dan'ish, a. (Giong.) Pertaining or relating to DebDank, or to ats people the Danps, or their fanguage. $D$. $L$ is the most changigd of the langeage derived from
 of and the lcelandic least of all. The political union Great, nad the inturconrse between the two nations that resulted therefrom, had a considerable influcuce upon the $D$. language to which the other branches of important and considerable was the influence exerted upon it at a later period from contact with the Gerbans.
The Reformation introduced another mra in the history of the $D$. languagr": and the translation of tha lsible into it pave it a fixed charactor, and raised it to the mark, a wrige fur time, and many Gallic terms were introdnced. A reac-
tion, howerer, took place in the latter half of the 18 th cent.; and since the beginnink of the 1sth, wuch has tongae, by the entahlishitis of it the purity for of the $D$. tuties, and by the writangs of buch ment as Bugkesen
 of Nurway with Denmark, towards the end of the $1+$ th ent., the D. Ints leven the litenary language of Norway; and it is aliso the hangoage of the celucated clabses, as well as that generaily moken is the towns, The mod ern D. is one of the moftest langamese ness spoken in Europe. When aforeigner hears it spekeo for the first tiale, he lardy jerceives any suands in it except the vocalic, the consonants being bu much hoftened in proamen is hence very perfect; aplear. The vocale bys in:uished ten vowels, the sound of which are all git dirfinct. The inflections ore few and simple, aml the haguage in one that may be easily masterell. Althong
 cent., yet its origin may be carriad back to the time of the Reformation, the oldest temains of the $1 /$ lan range do not ascenl higher than the 12th cent and cousiot of laws of the carly kiniss; as the Shausiee Lom the Sjellundske Lor, de. To the 12 th cont. belong the Norks of the historimes Saxo Grammaticus, and Evend Angesen, which, however, are in Latin. In the listh er we meet wita what secms to be the oldest of the b. heroic sungs, or hjanperiser, and which are etill more numurous in the 1 th, (collected by Ny ernp, Abra bamon, and labhek, 5 vols., Copenhngen, $1510-14$ suppement by Rasnussen and Nyerull, 2 vols, 1821 . anguage to the Reformation. The greatest writur of this periud in Denmark, and in is certain sernse the fomuder of the modern $D$. literatore, was Christiern Pedersen ( $14 \times(2-155 t)$, who, bexilens a number of wher works, had a principal hand in the translation of the Bible. The literature which thus received is stimulus from the leformution at bret specially tork a direction fowards history, as well as to investigntions connectid with northenn antiquities. There mpeared in the leth and lith cents. not only a number of wurks of the first mportance on the history of the country, both in $D$. anvestirations into the nurthern, entiguitios whiels have been so successinlly fullowell un by llakersem. Olawan Magoussen, Kask, lafor, Mibller, Themeth l'etereen Magoubsen, Rask, Kafor, Mifler, Thmmen, l'eterben, have commenced monediately after the Neformation. At first the sulycets worn cinerally of a nacred nator as we ree in the works of Kath, E. Pontoppidan, und others. Arrchüe, whe was the first of their epir poete, Lescribes, in his great work, the Ilexumerm, the events of the first six days of creution. D. poutry reached ita Fris cnlmination during the tiose of the lyric poet Thomas Kinge ( $160+1120$, nad his contemprotmy, dor gend versatile. A bew epoch commenced with the gon Hold D. stage. 11 e , in the first liall of the 1sth catitary Ewald in the second, are considered to matk the folden age of $D$. hiterature. The first ficuly mational tragediy was Ewald's Kolf Frage; and beside him, as drama tists, stand Sambie, Sander, and Thariul. Among the other poets belonging to this period, are Jebs Bagremen, 'ullio, Falster, Friman, Braun, Zetlitz, the brothers Trojel, fram, and others. A new ioyphim wis given to poetic literature by (Ehlenschlager (17i9-1>51), who had as contenypraves in the stome field, stoffeldt, lugeman, Grondtvig, Heiberg. Overskou, and others. Among the most recent poets are $\mathrm{H}_{\text {raz }}$. Blicher, Holst, Rusenhof, Winther, Vas Ionch, P. L. Maller, and MnMiiller, N. M. Putersen, 11. Euglestoft, J. Mubler, MelMuilet, N. M. Putersen, II. Euglestoft, J. Mither, Molimportant historical works have also breen producerl by G. L. Bader, F. L. Joho, L. C. Mïler, R. Allen, Batho sen, and Wegner. As publicists are distingujshed Dircknick-llolmfeldt, and Oswald; as statisticjuns, A. Baggesen, Bergsue. Nathansen, Ruff, and Auseheo. The brrices readered by Schuuw to physical grography, and
loy Ersted to physicsud chemistry, are will knuwn and by Ersted to physics und chemistry, are will known and acknowledged lar beyond the limits of their native
country. Among thedogians are Martensen Myneter country, Athong theologiane are Martensen, Mynster
Clausea, Nielsen, and Sclarling: and amoug jurista, A. 8. Ersitud, and Algreen-Ussing. occupy is iront rank. As a philologist and critic. Madvig has made himself a Europent reputation; while Westergnard, from him broudsted and Petersen, from their knowledge of elas sical antiquity, bate rendered gaod service to lemor ing. The works of Thorwaldsen, presented by the artist to his countrymen. have created a taste for sculpture and the fine arts gencratly smong them. nad given a new direction to thair mental culture. - Muderm Danish literatare of the lighter clast has been expecially en-
riched by the many admirable novels of IIas Christian Andersen ( $q$. r. .), whose works are held in high estimation in this country. In 1869 was puhlished, at oxfor the first part of a very valuible Icelandic-Englith dic ry, compiled by Richard Cleasby

city, never to returo. For many years he was doomed he left Yeroca, and went to Paris. Whexne. Emper Henry V11. invaded 1taly, $D$. returned to Veroon, and employed his powerfol pen to further the imperial cause. It was probably at this thine (1810) that be Florence, and the endden death of the Emperor $(313$ ) demolished tis last hope, and he speat the remaimins vears of Lis life under the kind protection of Guidu Novello da Volenta, in the city ef Kavenna, where he n . Sept. 14, 1321. Many citied of Northern and central Italy clanal the honor of having harlored $D$. withio their walls. His remaias were haried in a chapel of the Fruti Minori, io Raveoba. They were, however, subsequeDtly removed, and in 1 sos were discovered in the bracciotorte Sepulchral Chapel of the same city. lo 1830 on the marbie cenotaph was consecrated to las memory native city rendered tardy justice to the band thas his greatest som. When about 9 years eld, $D$. beheld, for the first time, Bentrice Kortimari, then \& years of age, und the love then eakindled is the heart of the teoder boy remaioed forever the inspiration of his life. How pure and chaste this passion was, may be seen from the poet's first work, Jitie Nuow, which consists of a coltbese prems is accompanied by a history of its origio, and ath accurate analysis. Beatrice was married to the cavaliere situone de Bardi, but died at an early age. A on old and noble death, D. Darried the daaghter of children. In hix work De Mmarchius he six or seven saprenzacy of the emperor 10 temporal, and thed the Pope in spirituat affairs. He wrote several ther works in Latic, besides maoy canzooes, sonnets, and lyrics in Italian; most of the latter were collected in his cimxito. Bat his greatest work - one of the most subtime prodactions which has ever emaonted from the getias of man-is La Dirina Commedia, a poem of world-wide fane. writteu while D. was a poer, wandering exile. It coasists of three distinct puems, or acts: Inforno (Hell), the Purgatorio (Purgatory), and the parded souls, places in hell and purgatory the fate of departed souls, places in hell and pargatory all those who
were remarkable, cither for their crimes or vices (especially those who were the anthors of his misfortanes), and in paradise thuse who lad done on earth. In compuny with Nirril, the representative of human reason, he descends to the inferoal regions and there describes, in sublime verse, the verions panishosents of simers; whilst in company of his lost love, Beatrice, the representative of revelation, and finally with St. Bernard, he views the glory of the celestial paradise. Lt Commedia was the first poem boor written in the Italian langoage: prior to it, all found in every country a host of translators and com mentators. The best Eny a host of translators and compoem are those of Cary, and of Longfellow. The trans poed are those of cary, and of Longfellow. The trang-
lation of the Inferno by T. W. Parsons, is both fathfal and clegant.
Ban'son, Grorges Jacques, a French revolutionist, B. at Arcis-sur-Aube, 1759. He was un advocate by profession of the revelutio the most active amony the detnagogne Lonis X VI. at Varennes, hctook the imprisonment of of Champ-de-Mars, whes, he took the lead in the meeting ment of the king; and ented in those seenes of blood and cruelty that have forever rendered execrable the name of Jicohno. Well qualified for the position he as sammat, bor, his became one of stentorian voice, and fierce prepared measures for the defence of the council, and it was thrmaned by the Prussian iuvalers amber when Duke of Brumawick. Ite was afterwarls it member of the Convention and of the Committec of Publse Sutely was a chjef protnoter of all the sanguinary acts of that torrible period. At length a nfruggle for anpremaci took phace leotween him and Robespierre in which the latter was successful, when $D$. was sent to the guillotine

-Not listeaing; wilfully dispurarding ; wot noved, per. suaded, or convincols determinelly indiflorent or inat-
teative; as, doff to argoment or entreaty; provediag to. Withont tiste, virtau, or flavor; withered; dectsyed; as, Lpeat, $r, a$. To deprivo of the power of hearing.
Deaf anal Dusuib. Persons who can nejther hoar nor speak. A person who is borudeat, or wiun lises has mary dufect is deafness; dumbiness is only the consiquence of it. Children ordinarily hear sounts, and then they bear otber prrsons sity. It is thus thent every one of us lats learned to speak. But the deaf chili henre nothing; cannut therefore imitate, and remains dumb. There can be no donbt, however, that there exists some connection between the physical conditions is geberally fungal to the more pruvalent tiatl in plain and flat districts, and in rural parts than in cities or towns. A marahy district, or an impare atmosphere,
nudoubtedly tonds to reuder it more common. The greater nuruber of these unfortunate perions are to be found among the poorer classes ; and lictree there is the want of necessary supplies and sttention during infancy and childhood. Among the other canzes that dnabtless tend to produce deafiness, arr interinarriages amode bear reations, hereditary predisposition, the of Switzerland the proportion is as high as one to every 500 of the jrojulation; while it is only 1 in 1,600 io Great Britain; 1 in 1,200 in France; 1 in 2,100
in Saxony ; and 1 io 2,996 in the Unital States. It is rein \&axony; and 1 io 2,996 in the Unitcul States. It is remarkathe that the defect is seldom transmitted direct
from deaf and duab pareots to children. "We cam from deaf and duab pareots to children. "We cam
show," sitys the princijal of the New Yurk Institution, deaf mute parcits to possess the ficulties of which their parents were deprised.: This fact is clearly established and there is thas no sufficient reason why the deaf and damb should not marry The education of then deat and dnoml, has only recently buen beginning tor receive a doe amount of attention. We are told by Bede that a deaf man was talught to repeat words and si-atchees

## DEAT

depends upon the nermous action of the mednila oblong.ta and spinalis, it is quite evident why $D$, may result from an inppured state of thee organs; and this mule of $D$. is of the nature of apmea. $D$. ruay sliso tee owca sioned by a disurdered condition of the bloud atself which at the sathe time weakens the pawer of the havart, impairs the a tivity uf the nerions asstem, ump prevent the perfirmance of thuse changes to the circulation which afford a powerfuc anminary orears in typhoid this is termern ond other diseases of a mallignant or pestikntial ever, und other distases on a matignamt or pect of culd kind. D.may aso reating all the vital operations of the sysocm. It is to be borne in miod, that $D$. is frequently problucel by a cenjunction, or by the rapidly following results, of two or nore of these modes; ind cet, the perfict listinc tion of these different molles of $D$. is almast exclusively confined to casps where the dissulntion is speedy or snd den. The signs of approaching $D$. are necesarily vari ons, and depend, in a great measure, upon the matur of the dise.se. Wre shill mitice gume of thase that int common to most discases and the seatars, inactivity of the cases there is a duiness of the seases, matnety
muscles, vacancy of the intellect. nod extinction of the mescles, vacaucy of the matiog froon old age. There is
 often of a mist interesting and pleasing character, sembinin! dre uning more tham auy other furm of dicrangement: sometumes, anjun, the dyine fancies of the fohnvidealare of the unot dreadfolly distressing character; but it is presumptuons, as miny do, to hazar much opon the various modes of terminating the carect
of life. In the delirima the reproduction of visual senof life. In the delirima the reproduction of visualsen entions of eu bears a consiterable biatt and requent the air, or picking at it on the bed-clothes. The scom of hearinz is frequently also affected, and imaginar of hearing is irequently aiso aflscted, ane husrl. $D$
voices, and soands of tolling bells, sc., are hasis mentia, or unental debility, eometimes comes on shortly before $D$, and for the mast part manifests itself in an incapacity of concentrating the ideas upon any our o ject, and by an all but total failure of the momory; this
meutal weakness often painfully manfexts itself in thi meutal weakness often painfully manifests itself in the apparent pleasare which the sufferer takes in come ofly
the most childish amnsements. The voice generally the ne st childish amnsements. The voice generally
becomes low and we.t 15 . $D$. approathes: but sume becomes low and weak its $D$. approsches, bumetime
times it his a shriller pitch than notural ; it is husky and thick; nod not unfrequently it dwiodle to a mere whisper. The mosenf.rr system generamy gradually feebler, but roore frequeot: the respiration grimatimes hurried and panting. simnetimes ceasin? gradually: and sometimes slow, i.tborions, and sterti rous. There is frequectly, also, an accumblation of fluids - mincons, serons, or purulent, io the brunchin tabes. What is knowa as the denth-rattle is produced by the passage of the air from the lnogs through the flaid collested in thy tr whea nod upper respirstory passages. The in ribund are often imputient of niny kind
of cluthing, throwing off the bed-clothes, and lying with chest bare, the aras extended, and tho neck as much
 exp is:n as possible. Araong the other sidne on hpprouchiot dissolution, are the sharpened nose, the forehead dry, tense and hursh, the complexion sallow, livid, or black; the lips cold, tl ucil, aod p.le, or of a lesdea hue. We be Wive thit the opinion which geaerally previals of th peit amonnt of safferinz that inmodiately precedes $D$ Hid which is expressed by such woris as the death Mrag.jle or agony of $D$. is very erroaeons. There is
very rason to $b-\mathrm{li}+\mathrm{ve}$ that an $D$, approaches, tho senWery reason to b-li-ve that as $D$. approaches, tho sen-
ibilities are gradually de tdened, and that in most casta Sbilities are gradually de wened, and that in most cast onsciousness has cens d before the strught eng arences. The musculat ph ishis- tho sow, gisping, of fangho in sona c cses necompanied by feeling, are alto gether ind ep alent of it. Convulsion is out, as super ficill observers often iravrige, a sigy of pain: it is an nervons system. Th sse who have mude the neare approaches to a-tad $D$, as io drowning, have deschine
their feelinzs as b bing of an extrem-ly pleasuratile kith and a lite prainent physician toll his atceadnd at oo his death-med, that he wishel could be at the We believe that driag is not less trnly than heantifully described in ssripture as being a falling asleep $:^{*}$ an idea which was also eotertained by the ancient $G$ who regarded $D$. as the twin-brother of sleep. The consequeoces of $D$. first become appareot in the organs of sense and motion: the eye loses its brightness, and the flesh its elasticity: the muscles become stiff, and cold ness and paleness spresd over the whole boly. Yet it
is often n very diff ult matter to distiugnish between is often a very diff ult matter to distingnish between
real and appurent $D$. The most reliable test is nforded real and appurent $D$. The most reliable test is nfforded
by the condition of the muscalar enlustance; for after real $D$, this gridually loses its irritahility, so that it cao be no lonser exrited to contractipn by any kind stimulation; ani this loas op irridity. The most satio factory proof, however, is civen by the ncemrrence putrefaction, which nsinally first manfests itself in th bine-green iliscoloration of the cutaneons sneface. eap cially of the abdumen, but which speedily extends other parts.
(Myth) It is remarkalle that the Greeks, whose on ceptions of an after-life wore so plenmy, slumbi have
represented $D$. as a pleacing. Eentle beran: white th

DECR
fom: to leun or bend asido or downwards; to make a lowering of the head.
-To lean or devinte from a rieht line or from reetitnde: swerre, to bend asithe; to fake tar ohliqne course. To fall: to fail; to deteriorate ; to decay ; to sink; to droop: to diminish: to clumge frum a better to a worsy
state: as, declining years.-To refuse ; mot to comply state: as, declining years. - To refuse; nut to comply to reject: av, to drectur a gownment nppor to one side to depress.
"With head drclin'd, and tove-dejected eyes." -Thomson. To shun; to avoid; to reject: to eschew; to be cantion not to do or interfere with; us, to decline a discassion, to dective an uffer.
forming the ohlingo the termiontlict as, to decluc a sulistantive.
etate; diminntion, deterioration, or decay; as, the $u$ cline of life.

Muase fathon
Mcd.) A popular name given to a slow wasting or emaciation of the berty, with a curresponding loss of health, energy, asd strength. This state is most fri quently the result of sonie organic disease, that, sympathetically affectin other organsand fonctions, throws the whole systom, as it were, ont of gear, nucturmiue the exlanastion it entails. Thonali pulmonary consump tion is the disease gencrally understond by the term $D$ it is coually applied to that ecrofnlons coudition of the ymphatic clands of the bowels called mosenteric uisecas by which the nutriment from the aliment - the chy? - is prevented from reaching the heart, when the patient, after suffering a long and serions emaciation, sinks from alsolute exhanstion, consequent on the di privation of new bluod. - See Athopir, Mesenter Dhee ise, Phertisis
Deelin'er, $n$. One who rejects, avoids, or declines. Dealimomieter, $n$. [Eng, decliue, and (ir, metron meanure.] An instrument used to nuasure the declion non form of the $D$. Vpon a tripod provideat with lece ling serews stands the pillar $p$, to which is fixed the

Fig. 780.-DECLINOMETER.
gradnated azionthal circle $C \mathrm{C}$. The compass-box B , with the vernier V, attached to it, moves on the azipprighta, U U, are fixed to the side of the compass-box on the tope of which rests the axis of the telescope T . A graluated are, A, is fixed to the hottom of one of the nprights, and the angle of elevation of the telescope is marked by the vernier on the arm E, attached to the axis of the telescope. A level, $\mathbf{L}$, is also hung on the axis of the telescope, for adjnsting the instrument. Inside the compass-box is another graduated circle, $\mathbf{F}$, the
line joining the zero-points of which is parallel to the line joining the zero-points of which is paratlet to tore
axis of the telescope. The compass-box and telescope move rund as one piece on an axis passing through the centre of the azimuthal circle. Wben an observation is male, the telescope is pointed to a star whose position with regard to the astronomical meridian is koown at the wime of olservation. The telescope witb the com-pass-hox is then hrought the proper number of degrees on the azimuthal circle, until its axis is in the meridian of the place. If, when the telescope is in this position the $\mathbf{N}$. end of the needle stind at the zere-porint of the inner circle, the declination would be $0^{\circ}$; but if it li E. or W. of this point, the declination is abown by the degree at which the needle stands,
Deeliv'ity, $n$. [Lat. derlivitas, from declivis - $d$, and horizontal line or blan, ro incline.] Declination fo scent of land, -antithetical to acclivity, - A downward slope: a gradual descent.
Deeli'vous. Decliv'tions, $a$. Gradnally descend ine: not precipituns; nslope; moderately steep.
 and comun, to boil. Sue Conk.] To prepare by hoiling.
or digesting in hot water; to extract the virtue from
by boiling: as, to drooct a berorage, - To stigeat by the beat of the stemach; as, to decoct fovd. - Tustrengthen or invigorate, lis by boilim-

Can soldeu water, thelr barley broth,

2) equerifon. n. [Fr., from Lat. decoctio.] Act of de cocting; a leviling

Med.) A term vesed in pharanary to indicate any nedicine prepared ly boaling, nud oppened to itfosinn, by which the article is sinply steeped in beiting hot an infusion. In proparing nedicinal $D$ D. the water shoulh always be purarel cold on the motieles, and at lownd to boil slowly. Whan roots, barks, hertan, or leaves are emplayd, the bailiug should never be continued for nore than tew mioutes, asnfter that time the gommy und resimous parts ure dissolved by the water, Dereoet ive, $a$. That may lie casily derocted.
iperoet'sre, $n$. A bubstatace or extract prepared by decoction.
Decollate, r, a [Lat, decolln, rifcollatus-de, nint collum, the neck.] To strike off the head from the trank

Deeallateal, $p, Q$. (Znib.) Applied to univalve shell in which the apex or head is worn oft in the progres of growth.
Decolla'tion, n. [Lat, decollatio.] Act of aeverims the head from tho liody : a behealiner ; $\quad$ ned chiefly Decolor, Decalanar, (de-kaltry) v. $w$. To bleach; to take the culor from
Decol orrant. Decol'onmant, n. Any substanco
Desol orate, Deqol'onarate, Decol'orize Decol'ourize, w, (lat. decoloro, decolordtusDecoloration, Decolonra'tion, $n$. [Lat, de maratio.] Kemesal or abaence ut evtur. be'conaples, a. [De, and compicx, q. . .] Composed zerconagos'able, o. That may bo decomposed; as, Decompone'
Decompone', r. a. [Fr. dicomposer; Lat, de, and com Tossparite the constimunt parts of a honly or snlistance. to distmite elementary particles combined by cbemiea atractian; to resolve into orizinal elements.
r. 11. To resolve a componud into elementary particles. Deeomapos'ite, $a$. Compoumber a second time; com (B,t)) Dith things already composite.

## (Buy Decompound.

Derompositiont, $n$. Act of decomposing; separation of the constituents of a sulustance daring putrefaction eparation of parts : resohution; Amalysis.
(Chom.) When componeds are resolved into their elegents, of when the chemical constitution of substances in this peration new products are formed, such proincts operntion, new prodncts are fition, Thes pro dncts are called the reatls of deconposition. Thus, aum-
monia is the result of the $D$. of certain amimal sulstances; carburetlind hydrogen ga* is the resolt of the $D$ of pit-coal, \&c: Chemists usc the terus simple an compound, or single and double D., to distingaish be tween the less and more complicated cases. When compound of two sulstances is decomposet by the intervention of a third, which is itself simple, or which acta as sueh, the case is one of simple $D$. water, for instance, is a compound of oxygen and hyitrogen. When the metal potassinm, which is is simple body, is thrown into it, it is deconphbed; the hydrogen is tiverated in the form of gas, and the oxygen combines with the poare produced, the result is calliql duelh or compler $D$. Thus, when potassh (composed of potassium and ux yror and hydrochloric neid (compoed of bydrogen ant chlorige) react unon each wther, chloride of potassinm (composed of chlorine and potassinm) and water (compuset of tydrogen and oxygen are the results.-A koowledge of the mutual decomposiug powers of different snbstances, or, in other words, of their relative affinities, cos it:tntes the skill of the practical chemist.-See Ar Finity, Equivilests,
decompasition of

Decompnsition of forces. (Phys.) See Forces.
Decomposition of light. (Phys.) Sce Larst
beesrnponnil', $n, a$. [Lat. de, axi conpono.] To com peund or roix with that which is already a compoond ; to compound it second time; ns, decom poundei 1 hodies. Boyle lyeconimponallable, $a$. Suscuptiblo of being decom
ponnded.
Deeo'rah, in Inra, a township and village, cap. of Win. sexinek co., on the Upper lowa kiver, about 50 m . N.W. of Juctregor; pop, s,iz3.
Dee'orate, $n_{5} \sigma$. [Lat decnro, decoratus, from decus, decorss, comeliness, grace, allied to decrt, it is seemly hecoming : Sansk, dis, from dic, to show.] To adorn : to ornament; to beautify; to deck; to emivelish, as, to decorate

## pec'ora

tere.
pecerntion, $n$. Act of adorning or decorating; as, the dicoratimn of the person, - That which adorns: embin lishment: ornament; resture; trappings : 88 , the deco rations of a labl-roem, church, \&e.

Mri.) A medal. cross of honor. lasdee of merit, \& his decoraistinguished services in the field; as, he w his decorutions.
(Fine Aits.) The D. of any work ahonld be confined strictly to the develupment of imprenions which the thuss itesift is intemed to cronte in strictmemature with

 abrolute mathetic neturdanee whit the oljevet whan beyl. Decorative, $u$. Fitted to cmbelish; adorniog ; ormaIDerordilvancow, $n$. Quabty or cajability of being ilecorated.
Decorator, $n$. One who benutifies, emhellishes, or ndorns: 16, a heukstidecrrutor
Dee'orons, a. |lat. decorns, from derus, decnris. Seo DECORATE: Sermls; suituble: bectming: decent: propfi:ting; nx, decirvas belatior, decurvas latignge, de Deeorousi

Delvire, $n$ Fr, from Lit, dilurium, from diluo- di aud luo, lavo, to wash.] A washing away of the earth ithy great overflowing of water; a Hood; an ioundation;
a dwell of water over the natural baoks or shore of the ocean.
A sudden, sweeping, or overwhelming calamity ; 36, deluge of trouble
rated in Scriptore, aod coment overflow of water narThis great event is ordinarily calculated to beve oe This great event is ordinarily calculated to have oc-
curred in the 1656 h year after the Creation, or 2293 years before Christ. We are told io Gent, wii, that all the fonntains of the great deep were broken up, and the windows of leaven were opened, and God cansed it t rain 40 days and 40 nights opon the earth: that turin that time the waters inerensel and prevailed exceediogly upon the earth, aod all the hish hills and muan-
taims were covered 15 cnbits and upwards; that all flual tams were covered lo enbits and upwards; that all flesh
died that moved upon the earth, and every man sive Nouh and those that were with him in the ark; that the Waters prevailed upon the earth 150 d.tys, and at the enu to pass over the earth und assiage the waters: the foumtains also of the deep and the windows of heaven boing stopped, and the riaio from heaver restrained. Noals entered the ark on the 17 th day of the $2 d$ menth; on the 17 th day of the 7 th month the ark rested upon the inumatains of Ararat; and on the lst day of the Is nenth of the year following, the waters wore dried up from the earth, nud about 2 months luter the earth it-
ectf iricl. Such is the concise acconnt of this great edf inici. Such is the concise account of this great
catastropliv gived in Saered Writ, a subject which has given rise to much discussion, and forminhed material for the cavillers at religion. Without going intu all the points connected with this snlject, we may brietly al-
lule to a few of them. We fint in the legends and traditions of most of the earlier races upon the earth (the ditions of most of the earlier racer ujmin the earth (the
Chinese, Hioduos, Persians, Greeks, \&c.), accounts of a eimilar catastrophe, and though gotnetimes they are in in allegorical form, yet they so elonely resemble the account given liy Jusers, that they hive geberally beatid rugarded as reforriag to the aume event. Even the
Mexicans, Perusians, wat ether rader nations of the new world, are represented as laving their tralitions of the
 wore formarery of the $D$. and early orler to explain the phethey fonod in the fossil remains imbedded in the earth
anquesthonable evidence of this univenal destruction but many of these were afterwards funnid to belong
 evidence that bears directly ppon this subject. The majority of the ableat scientrin men and theviogainm are now of oppition that the floor was only paraid agatust implons men, wat there wis no remain to lace lieve that the human race bail thon epremel themselves over the entire surface of the glabe, The word all, It aceordance with Eastern plaruseology, in not ulwaye in Soriptare to be taken in it strictly litosal sense: and heace, in the Hosaic weonnt, there is mothirge that can be regarded as contrary to the thew of the IS. being only
partaid. Tho olject to be cefiected was the shestraction
 of nugodly men, and if there be no reasun to conchate
that they were at that emery period extensively senttered abrosd, we think there is nbundmit "vidence to show that find is always very reomomient of has basang fect what may lee broughe ntout loy small. Inartad det nges not only may, but must have tecurrid; for w-have manistakable prosif that nuny lage matural rencervoirs luive been sadilenly tapped, and their contents let looso bung low lamis of vast extecit, wail it is not impurs sible that one of these events may have been reecnt enugh to juetify the trinlition that man was then ond
the earth, and narrowly escuped dentruction. - The the earth, hati narrowly escuped destruction. - Thed, must have been evident in the valleys, caverne, athd other placee into which water would whir nol husting difficult. Such loratition contain variuus necumulations, but the mode in which the deposits ocenr pruves clearly that the action of the water that oroved them was not dilavinl. Many succeesive events must have combinel before even the fatest chamiter of the earthia sirfice were brought abrout, and these changer all seem to lave brea
gradual, and to have involved slow clevation and degridual, and to have invol
jrexsion of very large areas.
Del'uge, v. $a$. Tocover or orerflow with water: to in undate; to drowo; to sink completely unider water. "Implacable, till dclug'd by thy fonm." - Philipa.
To overwhelm with any moving, sprialing boily; as, the contatsy is delugrd with grombacks. - To
er, or canse to sink nuder nuiversial calamity.

Corruption, tike a general tlood, abalt dcluge all." - Pope.

Deninot ika, atown of Furopean Turkey, on the Maritza.

weak, his speech stammering, and his gestares awk-
ward. Beimg firm of resolution, however, he retired for some years, aod by great perseverrance
succeeded in overcomind these de-
fects. In order to remeve the twe first bamed obstacles, he would dechaim inas-
cendiug steep hills, cendiug steep hitls,
or by the side of the roaring sea, with pebbles in his
month. To acquire elegant gentures, he practised betore a onirror ; and to correct a habit of
shrugging phone of shrugging up one of
his sluouldere, he placed a sharppuinted sword just wher it. in the place
where he stood. He

Fig. 796.- Demostilenes. (From an adoient bust.) had cultivated his mind by attending the lectures of Plato, and had atudied the principles of oratery under 1smeus. In a cave, which be imhabited for a long time, he would read asd pouder on the orations of others, and store his mind with the writings of great authors. On this account, bis detimacrs lectared that his orations smelt of the
latmp. At the age of $2 \pi$ he returned to pubilic life and lamp. At the age of 27 he returned to public life, and,
in conrse of tume, filled the highest otfictes of state. We in conrse of time, filled the highest offices of stiate. He Was one of the foremost is arousing the Athenians to a sense of their danger, whear the encreachments of Phimp delivered arainst Plailip the most glowing and pnngent orntions, which have become famons under the mame of The Philippics. Itesucceeded in prevailing on the Bootians to assist Attica, and whes Philip invaded Attica he joined the army, and was present at the battle of Chæronea; but bis conrage failing him, he turned his back upen the encmy, and fled. For this cowardly conduct he was afterwards tried, unt icequitted. After the death of Philip, D. exerted his influewce against Atex ander the Great, and succeoled in bming the varions Bnt the states iato a confedericy with tho Persinas. Sacedasion who ins soou hroked up by the vecorjons Thebons and hr pured edo tica. In erder to pacify Alexander the Athenimeseot an embassy to him, of which $D$, was a member; but approad. From the victor's wrath, he threed hack ons th death of Alexamier, the Athenians declared war agaiosi Antipater, his successor, but were defented, und ordered to deliver up Demusthenes, who fled to Calithria, and poisoned himself in the templo of Poseidon, $3: 2 \mathrm{~B}$ B. C Subsequanty, the Atheminas crented statue to his momory, ami educated his eldest child at the public ex pense, - The maie characteristics of $D$ 's cloquence ar
m.tjesty and vizor. His oljoct was less to excite the m.djesty and vigor. His object was less to excite th slanding: ind this, Cicero has declated to be the en betuce of true eloquence. Ho seltom or wever spoke ex tomporancously, but utways prepared his speechee with the most ussiduons cave. They are to this day considered the purest models of oratory in existence. With rogatrd to spmatancoos forceand readiness, he is, perhaps, interior to Cicero; but ho surpassers bim in subtilty of thought, streuzth of logic, und rhetorical pawer. The Dintorf. Dinilorf.

Deatitions.
enti tion, n. [Fr.; Lat. dentitio, from dentio, to brees teeth, from dins, "tonth.] The breedng or
seeth in infincy; the time of breediug teeti.
(Physiub. ani Mrd.) At birth, the teeth comsist only of pulpy rudiameatary substancess, buried in the coum;
and it is not till the thind or fourth month after birth, that they begin to assune shupe und turdness. At this perinad chilisren become muensy und fretfol; the gmu is red aud swollen, accoupanied with a feeling of itching, which is munifsted hy the eagerness with which they
press any haril snlistince agaiost the koms. The salipress any hard sulistance agaiost the goins. The sulivary glands sympathize with the gums, nud there is a
copions discharge of saliva Frequenty, these eytopcopiont discharge of saliva Erequenty, hase syropnure constitutional nature. The skin becomes dry nad hot, the face flubhed, the bowels relaxed, and the child
 spars on the shiu, called the red gum; and if the irri-
tation extends to the muscleg of the clest, there is a dry and troubhemome congh. When the inthnt is in a tolerably healthy stite, these symptonns usually suisile in the conrse of two or three weeks; but if it be iu a woakly condition, they frequcnty lead to serious and
sumetinues fital results. The mucuns memurane whitch lines the stomach and intestioes may be affected with that of the month, and griping pains, mansen, romiting.
diurrheas, and other disorders, nuay be the result. The external skin, sympathizing with the internal covering. may be affected with sarions kinds of eruptions; thin nir passages and lungy may also become inthuned, or
the bruin an Inervous syatem may tucome diseased, producing convulsiuns, cpilepsy, tetams, se. The enteng of the teeth asudyly takes place between the severoti and sinth month, thoush sometimes it is mach later. Thu gman again becotues extremely seositive; but, intstead of now beiag edsed Gy the pressurvora hard sill-
stance, it canoot endure the slightest touch. It is red and swollen, but paler at the opper part, which. just befire the tooth spprars, seetus covered with a flat whit thuse already described, with frequeat eruptions abont the bead or lips, indaumation alont the ears, and occaaionally epasmidic movements of the month and jaws. These diseases are not always confined tu, the periol of
infancy; for in irritable and nervons conotitutions they infancy; for in irritable and nervons constitations they
eometimes manifest themselves (though nonally in a less eometimes manifest themstives (though nsnally in atess
angravated form) at the irruption of the secoud or peraggravated formi) at the irruption of the secoud or per-
numeat teeth, nud even occasiunally when the dentes sapiventice are about to make their uppearance. As the great excitiog cause of these disorders is the lecal irritation in the gnmas, the great object to be kept in view irritation. Where that is considerable, the goms ought to bo freely laced. As the flow of saliva and diarrheeta are effurts of outare to carry off the ioflammation, these
are not to be interfered with, mulcas the latter be exare not to be ioterfered with, nulcss the hatter be ex-
cessive, in which cuse it is to be cantiously corrected by smas! doses of mugnesia, or carbouate of lime. Wher the bowels are confined, snall doses of cooling laxaand eppressed respiration, irregular movements of the jawe, or convulsions, a leech or two to the temples, and a small blister to the tack of the peck. or buphind the esmetines be of benefit; bot they ought only to be ad ministured with the atmost caation, and never intrnsted to the nurse. Extreme caution shonld also le exer cised in meddling with any eruptions on the skin. (Zantl.) A natomists are in the labit of briefly expressing the namber of the differeot kinds of teth io any mammal by what they term a dental formula.

N. American species are numerous. Bnt this genns ie chiefly remarkable for the periodical moveurents of the leaflets, in some of its tropical species. In D. gurans, let beiog much larger than the two latonal ones. Wlun let heiog much larger than the two laternal ones. When exposed to the intuence of a bright light, the larger proach of evening, it falts duwnward. The lateral leatlets are in constant nution durige the lient of the day, advancing hy their edges towards the large teriminal leaffet, and then retreating towards the hase of the common petiole. This movement takea place first on one
side and then on the other, so that the point of each side and then on tho other, so that the point of each
leaflet descriles a circle. As these movements rescmble leaflet descrilies a circle. As these movemens rescmile plant has been naumel the Thlegrophoplant. Nus sistisplant has been nimned the Thegropht-plant. Nus satizlactory explanation of the cause of the extruat
movements of the leaftete has yet been given.

Di'et, n. [From Lat. dies, s day;
day of assembling, or the assembly itsplf
(Hist.) By the usage of the German Empire, two D. were summoned every year by the emperor. There were three chambers:-1. That of the electors, $q$. v.; 2 That of the zovereign princes, divided into two spiritual, and four temporal benches; 3. Tbe chamber of the imperial cities, divided into the Rheoish and the Swabian beaches. The D, together with the emperor, exercised the prerogatires
of sovereignty. A decree of the $D$. was termed a recess of sovereignty. A decree of the $D$. wad termed a reces
of the empire. - The $D$. of Iungury is, accurding to the of the empire. - The D. of /Iungury is, accurding to the
constitution, composed of the king (emperor of Austriti), and tho estates. The latter consist of the higher clergy, the ruageates, the two courts of appeal, sad two representatives from each chspter, county, city, a od privileged district. They are divided isto two chambers, called tabude. - The $D$. of Stoitzerlund is composed of the representatives of the cantuns, and manages such affairs as by the federal constitution are exempted from the jurisdiction of those several independent states. It is held every two years, alternately at Zarich, Berne. and Lin-
cerne, which are termed the presiding cantuns (1orort) cerne, which are termed the presidiag cantuus (Torort). of the presidiag canton is landauman of Switzerlaud for the time being. Eich canton has one vote in the D.From a very remute period, down to Is32, Polund hind national assemblies, or $D$., wbich were of two sorts ordinary, and extraordinary. The ordinary $D$. was held every two years, and usually at Warsaw. The D. was composed of a selection from the aobility, who formed what was called the senate, and uf the depnties returned hy each of the palatinates and districts of tbe country. The number anounted to about 400. The period of its meeting w.s fixed hy the kiog, who presided over its
deliberations. The extraordinary $D$, were convoked only to listens to propositions from the throne, and lust only four days. As is well known, the throne of Poland was not hereditary, but elective; aud, on the occasion of choosing the sovereign, the Polish $D$. were held it the open country, and were attended by all the nobility on horseback, armed and equipped as if for battle. Ou this subject the resder is referred to a work of great ahility, by De la Birardiere, entitled Histoires des Dieles de Pologne pour les Elections des Rois, depuis 1572
jusqu'en 1674 (8von Psris, 1679 ).-Diotines wats the name jusqu'en 1674 (8vo, Psris, 1679 ).-Dirtines was the name
given to the particular assemblies of the Polish nobilits, given to the particular assemblies of the Polish nobility, in which deputies were elected to serve in the ordiosiry $D_{\text {, }}$ and to represent the wishes and interents of their constituents. In these dietines every gontleman pos and every deputy was chosen by the masority of suf frages.

-Calculated to indicate difference of motion or results :ased io relation to machinery.

Math.) Having reference to differentials,
Differen'tial Calemins. n. (Math.) A term applied to one of the mont important branches of the higher matbematics, and in which magnitudee are contemplated as susceptible of continumus growth. Broadly speaking, the object of the D. C. may be suid to be the deter-
mioation of the ratioq of the differences of mutually demioation of the ratios of the differences of matuatly de-
pendent varialle magnitudes, on the supposition that these differences become infinitely smoll, - An hypothegeneral calculation of differences. The infinitely small generation, increment or decrement, of s quantity is termed its diffrrential, and is expressed by writing the letter $d$ before the magaitude or function: thus $d x$ signifies the differential of the variable macnitude $x, d$ $(x y)$ the differentisl of the product of the two vuriables $x$ and $y$, and $s 0$ out. The differential of a diffurential is
called the sremul differential, and, $x$ being the variable, called the sromul differmtial, and, $x$ being the variable, is dewoted by $d$ d or more briefly by $a^{2-x}$. In a simi-
lar manmer $d^{n} x$ is the ne differentiul of $x$. The lett Int tuanser $d^{n x}$ is the ner differentid of $x$. The letir
$d$ was introduced by Leibnitz, and is now adopted by all writers as the eymbor diffrentame. The D. e, al
atic form, and grently cxtended, by the two celebrated

Intriavibility, n. State or quality of being diffasible
Ditrus'ible, $a$. That may be diffused; that may flow be spread in all directioas; that may be dispersenl.
(Med.) Applied to those stianulating meticiaes which gaent the sction of the vascular system.
Diffu'viblenes⿻, $n$. Same as Diffusbality, $q$.
 Drffese. Act of diffusing; a spreading or bcatteriug
dispersion; dissenination; spreml; propagition; cir culation; as, the deffusion of learning, the diffusion of species.
(Crom.) 1. D. of gusen. If two vessels be filled with two different gises, und counected by a tube, it will be equal internixtare of them will take place. If, however, an'an be taken to measure the velocity with which thiry mix, it will be foond that the lighter of the two diffuses itsclf much mora rapualy than the heavier, and vice versa. This velocity of D. nay be messured in the following manner:- If a glase tube, closed at one end with a porons phag of plaster of Paris, is filled with ing
drogen, an! pluaged mouth downwards, the hydrogen will gralandly pass through the porous diaghragou into the air, and the air will gradually supply its place. But it will ho found that the hydrugen hiffuses itself iato the air much more rupidly than the air into it, causing the water to rise in the tube, contrary to the action of gravity. Mr. Gruhatu and others, ly a singular upparatus, have idetermined the exact rates of D. of an gases, which appear to be in accordunca with a law that the relative of their debsity, taking air as the standard. The foHlowing are the velocities of $D$. of some of the more familiar gasem

Orderly arrangement ; distribation in order ; act of reduciog to classification and method
The digeation of the counsels in Sweden is made in the senate."
(Surg.) A term formerly applied to the treatmeot hy which wounds or ulcers were brought into that state in which they found hesthy pus; the remedies or upplica( (V) cm ) The heating of a substance in a ligaid, in order to extract soons principle contained in it. It is distingushed from maceration by beidg performed at a high teuperature.
(Physiol.) That procese hy which the food of animals is converted into chy me in the stomach, and prepared for being altivately takea into the blood. The functhat are directly concerned in the maintemance of life ; and hence its proper performince is of the athost int portance to the individual; while dependiag, as it does upon the healthy cundition of a great number of organe, it is not to be wondered at that it is liable to disurders, and is productive of an endless variety of diseases under the geaeral term indigrstion. The principal processes coonected with digusion are nobally represented as 1. Masticotion: 2. Insalteution; 3. Deglutition; 4. Chymification, or the action of the stomach ; 5 . Chylification, or the action of the intestimes: 6. Defecution ; and 7. The absorption of the chyle. The operation of the more food is trot down and mixed with the saliva the more readily and completely wall it the acted unon by the stomach. Imperfect mastication is a frequent canse of indigestion. Duriog this procese the ealivary glands yield up their contents, by means of which the dry food is moistened and rendered mors fit for tegluti-
tion. The third process is the act by which the foud is traneferred from the mouth to the stomach. (See Dkglutitiox.) The alimentary matter being propelled by the contractions of the curdiac tremity of the stomach, is there acted upon and dissolved by the gastric juice, which is spereted by glands lying in its inner or mucons cont. sieted by the pinscular contraction,
of the stumach means of which the mars is kept it nution until it is formed into chyme. DIGN
DII
denom, mixes with the biliary, pancreatic, and intestinal secretions. These juices, hy their nction apon the chyme, separate it iato two portions, - one a milky thaid called chyle, the other the excrensentitions portion. The diges
seems to lie of use primipally in promoting che diges
 manaly to convert starthy phatters into sogar. Of the use of the infentimal juice little is known. The chyle attaches itself to those irregular circular folds of the mucous onembrane of the spall intestines, called the volvule conniventes. where it is absorbel by the lac teals. The harge intestinu also possess lacteals ; so that, if any portion of the chyle should not have been ab-
sorbed io the small intestiges, it is taken pp io the sorbed is the small intestiaes, it is taken up io the
lurge ons. The faces pass gradually from the small to lurge ons, Thte faces pass gradumily frem the rectum, in which they are retained for some time, and then discharged. The absorption of the chyle forns tho taken np by the lacteals, and is liy them conveyed to the neseateric glands, where it is supposed to unterge some change. From thence it maked jts way to the right side of the aorta, is the lubium region, where it is finally discharged into an elongated ponch, called the receptactulum chyli. From this pouch the thoratic duce conveys the chyle upwarils to the left sile of the aeck where it is poured juto the laft subclavian veis at it, junction with the internal jugular, and, being thas mixed with venons blood, it is carried to the fongs and

This pifinions of Cirinst, or Campoellites, (Ehel. Hisf? denomimations luddy, which is "t liranch of the laptis of Goil, and rejects all dertrines or terms as binding which ure fonnded on epeeculationa of theology. It grew into a buparate denomination under the influme of the example and teachings of Theman f'ampbell, n bo mettled in Ponn-ylyanin in iNas, na a mulni-ter of the "Sced era," mand of his fon Alexander. The father was a conncientionn sulvocate of whipions reform, and contended
 practice cas erserp. specini etndy of the Scriptures, who were ts reject all cremp. This grew finto a congrevation, of which the Camplefls became chlera. An invewtigation of the sub ject of Baptixm leil them to the belfef that immersfon was the only soripturat method. For anme yoans the churchars which were formad were attached to asmein tlons of Buptists. In 18:23, Alex Camipledil pentabished the "erbrizfion Beppest." Thrubgh this monthly, and l.g ecveral public oral deluates on baptiam, aull extemalie tours of preaching. his viewn apread rapially ant widely numog the liaptistr. Bit personnt usphaition at lnot took tha form of ecclemanticial action, and in Not the Dover A"sactiation of IIrginia neereed the excommunication from Baptist fellowahip of nil who hrld and udthe beginning of a gelueral nction ainnug, the Baptsats bubl the lieformars, an they were calleml, were compelled to nexuchate in a meparate organiantion, which rapith
 moin, Musnnri, and Virginin. Chumeheo were alue formed in the Hritimh Proviucen of Nurth A merien, In Eiggland, Wales. 1 rehanel, and Auptralia. The dieciples an Congregational in their orkanization: repand very high gospel; areactive and energetic, nod acevinl in eramential
doctrincs with "evangelical" Christians. Their colleges are : Bethany College, Kentucky Lnisersity; the North
Western Christian University, at Indianiolis, Ind Evreka College, III.; and IIram Coltege, Ohio. They Etreka College, III.; and Iiram College, Ohio. They 1 ynarterly. Of these, twa (monthlies) are phblished, one in Great Britain, andone in Canada; all the rest it the Umited State
Disciiplews, $n$. A female disciple. (R.)

 into their elementary condition, This is a spontaname decamposition, teot deterninal by noy chamical actione and that to which Ilenti Kt. Claire- Neville, who dis coverel it in $1 \begin{aligned} & \text { sinin, gave tho name of Dinuciation. M. }\end{aligned}$ Deville's law gives a rational explanation of the actiom of moses, i. es, to the action of two bodies which muthe ally chase each other from a compount, the one which is in excers taking the place of the othere. Af. Deville has been led to conclude, from his evperiments, that in the decomposition of twalies by hent the phenomena are the same as in the vajurizition of hquids, As the change of a 1 quin quatity of ain quantity of heat, which is entirely ahmorbed (bo cothes latent, so in the same manher a compruthil hody, of heat equal to that which it disungages whan it is recombined. Sujpose, for example, that we hent the vapor of water to $1: 20{ }^{\circ} \mathrm{C}$. in a large excess of chlorine (water being composed of oxygen and hyltrogen), in stnall quantity of hydrogen anll oxygell will be libserated. The free hydrogen lias a tendrncy to combine cithor with the chlorine or the oxygen. lint the oxygen heine prow ent in vary fechle qunntities, ne compured with tha chlorine it is with the hatter element that the grenter part of the hydrogen will mite; if this process be coninted, as morre water is destroyed than is reconstructed io course of time tha wholv of the water will he trans
formed into hydrochloric acil. If, on the other hand we heat hydrochlorine neid in in great excess of oxygen, the hydrogen dissaciated from the acin will contine with the oxygen and the liyilrechloric acid will lec trans formed into water and free chlorine. The phenomenn are the same, hut in an inverse order, - According to Dumas, the "plenomenon of Lissocintion is one of the most important acquikitions, not only to chemintry hut to natural philosceply. made in monlern timus. It has allying chemicul decompositions to the purely phyation phenomena of the formation of vapurs: nail phesomes that there exista a tunsion of ducompoaition analogon to the tension of vapors, and that the evaporation of liguid, or the dremposition of a curbonate, is +ffected liy virctie of the anme latwe. that Daitons law of the tension of vapore was to phyrics, is Deville'r luw of the
turion of difesoriation to chemintry " From experimurnts mate in 1 S6it, and publisherl in 1 Nitif, it nppears that the theory of dismociation is chpmble of extended appitiea tion throughont the whole field of metallarge. When sive application in the reductions of botins to their elementary conditione, in the preparation of pure gases, in metullurgical operntions, de. lately, in this country, the American peolngist Sterry Hunt hax hal recourge to Deville's theory in explunation of the origin of rocks, bissolnlisl'ity, $n$. boiler containing the water to Le distilled; B is the ly the reck $\mathbf{C}$ with the worm $\mathbf{D}$, a pewter pipe coilet by the nech C with the worm D , a pewter the boiler, passing into the worm, is cmulensed to the liquid state, being cooled by the water in contart with the worm; this water becoming heated, passes off thronght the pipe $G$, being replaced by cold water
which is allowid to enter throughi II. A rosctte gasburaer, $K$, on Bunsen's principle, is very couvenient for a small still of that description.
(Applied Ctem.) The process of D. is carried on rpon the most extensive scale for the production of ardent spirits in the distilleries. Under the words Alcobol, kermentations, Wine, \&c., will be found some details
hearing upon the nature, sources, and production of hearing opon the nature, sources, and productuon of
spiritnous lignors; in the present article, therefore, w spiritnous liqnors, in the prescine of the different pro-
shatl limit oursclves to an outline cesses of $D$. - There are two distinct operations in the prudnction of ardent spirits: the one in the convereion of certaia vegetable principles into alcohel; and the other, the separation of the alcohol from the other substances with which it is necessarily blended during ita production. The vegetable principle which is essential to the formation of alcohol is sugur: and this is some times used directy. as where molasses and malogou eaccharine products are subjected to immediate fermen tation; or it is indirectly obtained by suhjecting amylaceous grains to certain processes, by which the starrl
they contain is first converted ioto sugar, anll then tbat sugar afterwards alcololized. In our diatilleries the latter alternative is adopted; and various kinds of grain, bat chiefly corn, barley, wheat, and rye, with more or less malt, are subjected to the operation of moshing. For this purpose the ground grain and the bruised malt are duly mixed, and infued under constunt agitation in t proper quantity of hot water in the mosh-(un; the wort
is thea rua off, and fresh water added, till the soluble materials of the srain are extracted. The mixed worts, or wash, thus obtained, is run into the fermedting vats, where, mixed with a small quantity of yeast, it is subfromsix to ten or twelve days, the time reqnired for it completion sarying with the mass of liquil, and with the temperature of the atmosphero. During mashing the starch pisses into sugar, and duriog fermentation the sugar chanzes into alcohol; the consequence of which is, that the wash gradaally decreasea in deasity, or attenuates; and as soon ns this attemation has reached its maximum, which naty he determioed by the hydrumeter, it shonld be distilled in order tu prevent the commencement of acetic fermentition In all large distilleries there are two sets of stille one for the purpose of distilling from the wash a weak re-distilling (or rectifying) the low wines. In these $D$, there passes over, along with the first and last pirtions of the spirits, a perulior volatile oil of a disagreealhe of the spirita, a perultir volatife oil of a disirit milky.
flavor and otor, and reodering the weakr spirital These portions are called foints, and are currfully turned into separate receivers as soon as the appearance of the runnings from the worm end iadicates their pres-
ence. It is not our province bers to enter into an ence. It is not our province here to enter into an

Surg) A pibs aod ditortions of enthushom. -Additom. (Surg.) A permanent teviation from the naturnl slanpe or pusition of the boty, prodncing eible dy uccurs after biith, and thus differs from defornity, which is for tho most purt congenital. D, is frequently ocensioned by affectinos of the minsel or arnished with that every monat of which it is not only unoced, but also retaimed in its natural position. Hence it 28 evithent that, if, ly means of injury to one of these suts of moseles, or of the nerves commanickting with them, their contractility is destruyed or impaired, the part call no longer be mainatained in its natural position, but wall be diruwn tuwards the antagonistic muscle. In this way various kinde of latuene6s, wry neck, sinuinting, \&e., are plotuyed. The most common cause of $D$. how ver, is clisectse of the bones, These are sobetimes deficient in the carthy matter which gives them hardness and ripidity, und thas are incupalyle of supporting the weisht of the purts which they are de without becoming bent and distorted. Ftom this urises Withont becomng bent and distorten. The D. known as the disease known as ricticts, q. Ves from wenkness in the vertelral muscles, inducing a hubit of resting the weight of the body more on one side than on the other Unlike rickets, which communce early, this does not usually make its appearance lefore the tenth ywar, and is commonly found among slenuler nud deleate females in the higher and midtle runke of lite. It is generally occasioned by too minch confmement had restramt, and is best got rid of by plunty of free exercise of the limbs in the open air. Auguiar entiraly from the atoove is occusioneli, for the most entircly from the atove, and of ons or more of the vertebrae. The support in frunt being thas lost, the spine is bent sharply for wards, and one or more of the nphenes processes project lebind. I'erfect trost in the holizontal position, issues and setons in the neiphbanhood of the disersed bone, and attontion to the genemil health, is the trentant to beadonted in this case. Diseases of as sill
ilar kind frequently ocenr in the lones and joints of ilar kind fregnently occur in the lones and joints of other parts of the body, and ruquire simint treatment D. may also arise from a varicty of other causce, as

Divin'er, $n$. One who professes divination; one who pretrans up preciet evente, or to seveal uconit thillgs, by One who guesses: a conjecturcir
Divisif, $n$. The act of descebiong in water.-Independently of the valmable native productions which are found at the hottom of the sea, such ux pearif, corni sponges, \&c., the treasure which is so frequently carried down io wrecked vessels makes it an ohject of impor tance to be alde to descemin to the bottotn, and remai there long enough to exernte the operations necessary chanical apparatus, evep the must practised divers car chamical apparatus, esed the nust practised divere can longest time that a diver. in general, can remain under water. Besides, on account of the loss of weight in water, the power which a man can exert is extremely em.all, unless lorne down by a load which would entirely prevent him from risigg agsin to the top. Or the artificial expedients contrived to render a longer stia bebeath tho water practicable, besides the Diving-beL (q.e.), one of the most advantageona consists of a partial covening for the body, made water-tight, with a metallic helmet entirely protecting the head (fig. 838 ). The diver is supplied with fresh air liy means of a flexible waterwith an air-pump, worked alove in the larre from which he descends. This pipe passep unuler the left arm of the diver, and enters the baick of the belmet, heing so contrived that the frebh air is made to impinge on the glasses, which, in a great measure, prevents their being dimmed by the puistne of the lireath. From the back part of the helmet there is
also ied lan eduction-pipe, to allow siz wail-line parsses nuder the right arm to commanicate with attendants at the surface. The viver vessel, vither by means of a rope or a woonlen ladder, loaded at the lower end: the weight being ground. When the diver descend to the bottom, the weicht is tet lown, and the rope allowed to

Fig. 838. distine tack, to prevent the motion of the troat from maxy with tino in his hand that to hay, when ; and he carries thimscif buck to the rope. A water-proof drese covero his bredy entirely: and he is thus enabled to remain perfoctly dry or six hours at once, heing all the whit perfectly dry. In 1880 Mr . Fleuss patented a prucess most purt with the cumbrous apparatus that divers have bitherto hal to employ. Io this process, the power of breatinng depends on means which are provided within the belmet worn by the diver. These means are denigned to farnish a continaons supply of oxygen, and lodispose of the curbonic acid which the the brenther exhates. No provision is made fur nitrogon which enters into the composition of ordimary nir for this mercly servesasa dilueat, and is but changed or diminished in quantity by breathing: hence the nitro. gen which ia naturaily present in the diver olungs and over maxin, and is amply sufficient for its purpose. Tho oxygen is atored in tho helmet in a compressed an pruid at solntion of soda, cintined in a clure en single char bing whenestinn of tho carthonic acid A use of the yqurat ur Actual use hus proven the nuecersas of this invontion.
Wiving-becil, $n$. Divorce', n. [Fr.; Lat. divortiom, from divero. Se the Verb. A separ
-The cause of auy penal separation.
"The long diorce suet tallo me"- Shat
-The sentence or legal instrument by which marriage is dissolved,
(Lave) A separation of husband and wife: nod which is either a D. a vinculo matrimonit (from the bond of marriage), or a mensa et thoro (from led wad board): the inarriage in the former case being dissolved; the parties being only debarred from lising in the latter, the parties being only debarred from thimg h.th taken a wife rod married her, aod it come to pass that she find no favor in his eyes because he hath fou ud of divorcement, and give it in lier hand, and send ber out of his house." (Deut. xxiv. I.) After nidety days the wife might marry again; but after she bad contracted a second mirriage, though she should be agaio divorced her former huskand might not take her again to be his wife. The like lix notions on the sulject of marriage appear to have prevailed renerally in the East at that early period; nod even at the present day -as among the A tabs - a husband can divorce his wite on the sigigh Arahs, not more than forty-five years of age, who werc bredau law allows of a separation by mintoal consent giving the wife the right of retainiog her marriage por tion, unless she agrees to relinquish a part of it as the price of the separation. Thry are permitted to separate aod reunite twice; but, after the third divorce, be cannot again receise her until slie bas beed married and
divorced by another. Among the Iindoos and Chinese. divorced by another. Among the Mindous and aud a hus hand maty divorce his wife upon the elightest grounds, reven without assigwing any rearation, are l upacions hess or quarrelsomepess on the part of the wife. The laws in the Greciso states, regarding divorce, differed greatly from each other: in some, it was permitted on Elight grounds; in others, the laws were stringent regarding it. At Athens, divorce was permitted on singht canses, but not without giviug a bill containiog the archon. At Sparta, divorces seem to have been sery rare. By the early laws of Rome the huskand was not allowed to divorce bis wife without just canse, as, for adultery, drunkeoness, counterfciting bis keys, of poianding his childreo. and at leagth divorecs twok place on very frivolous pretexts, and the womell enjoyed the same liberty as the mea. Hence Angustus iotroduced a law eoacting additional ceremonies in obtivining a divorce, and requiring the presence of seven witnessen, before whotn sian code, among the canses for which a hushand could divorce his wife, were aluitery, the being a witch or a murderess, committing sacrilege, violating eepulchres, or linying or eelling one free-born to slavery, fisoriog thiuves and robbers, frequenting sights or theatres,
fecding with strangers against the wishes of her bis feding with strangers agiast the the being privy with those that plot against the stato, or dealing falsely or offering any of thesc cribses. could prove the hisliand guity of any of buese criders, she also wis at liberty to leave ham, mation ontil after the expiration of year whereas the hushand might marry again immediately Voluntary divorce was abolished by une of the norels of Ju-tiniae, but was afterwarda revived by aoother noved onder the Eiuperur Justin, aod the practice is underetuod to have continucd in the Easteru Empire down to the nipth or teoth century, when it was fibally subdued by the influence of Curnstavity. The Scripture doctrinc on this subject is euubciated by our saviour when he berioning made them male and female, and sitid, Eir berinning cause shall a man leave father and mother, and shall cleave to his wife, and they twain shall he one fleak." "What, therefore, God hath joined together, let not mao put asuoder." "Soses, because of the hardness of your hearts, suffered you to put away your wires; you, Whosoever shall put away his wife, except for for nication, aod shall marry another, committeth adultery and whoso marrieth ber who is pht awny, doth commit adnltery." (Matt. xix. 4-9.) Onr Saviour's declaration
maturally hecaue the foudation of the law of divored
in nll Christinn conutries: and after marriage was raisel to the dignity of a sacrament by Pope Inmocent III., in 12h, the eceleshatical courts chamed the sote jurishic-
tion over it. The papal canot law regarded the loond of marriage as indissolulife, but allowed a divorce a menea et thoro, for five eanses, viz, ataltery, impotency, crumty over, assumed to iteclf a power to grant dispenation for atisolnte divorces. The primcilite of the canom las (not almitting of an aliselutedissolution of the marriag contract for any canse whatever) guverned the reclesi-
astucal Jow of England. A divare was only a judicial beparation a mensa et thoro, nut alluwing vicher of the parties to marry again during the lifetine of the other An individual, however, if nhle to incur the exprons might, after a sentence of divorce a mensa et thoro, (pro of parliamsent), procure a suspension of the law, and by riage. There ware centuin causes bownur which wa regarded as nullify ing marriage, and justify ing adivore a vancal matriminit; ns, a previous marriage still sul
sisting, or aflinity within the proscribed degree, - th sentence in such a case heing decharatory only thit th marriage was originully null nad void. The law of
England granted judicial separation only on the ground Eugland granted judicial separation only on the grounds
of adnltery or cruclty: and the offect of it was to place the woman in the same pusition as n femme solc, emablin her to hold and deal witl property free from the contr him from all obligation to supprort his wife. By Acts 2 and 21 Vich c. 8.0 , an entire change was effected in th
law of divorce in England, and a court instituted wit law of divorce in Engiand, faters matrimonial, and with suthority, in certain cases, to decree the dissolution of a marringe. The eotire jurisdiction, therefore, previonsly exercised by the ecclesiasticnl courts in matters of divorce, was transferred to this Court of Divorce and Matrimonial Causes, anti sentence of juticial scparation
(having the same effect fas a monsa et thero) may be olitained either by the husband or wife on the ground of adultery, or croelty, or desertion withont canse for two years and npwards. This conrt has also the powe of dissolving a marriage on a petition presented by the
hushand. setting forth that his wife had been gnilty adultery or on a petition ty a wifi, on the groumd that adultery; or on a petition ty a wite, on the groumd that
her husband had been guilty of incestuous adultery, or of adultery with cruelty, or adultery with desertion for two yearsor ppwarls. It is the duty of the court nut only tos sitisfy itself as to the facts alleged, but also whe ther or not the petitioner las lueen in any manner accessory to or comniving at, the adultery, or has condoned whichame
and shall also inquire into any comnt er-charge whichay Ine made against the petitioner. In any of these cases, if there is reason to believe that the petition is present then the court shall dismiss the said petition. The cout may also, if it secs fit, order the huskand to secure may also, if it secs
the wife such gross or annual sum of money, for any the wife snch gross or aon life, as it may deem reason able in the circunistances. It can also allow d.tmase if asked for, against the adulterer, and may abo order him to pay the costs of the proccedings. It has also the power to declare in what manner such danages ar to be paid or applied, and to direct that the whole, or any part thereof, slall be settled for the bencfit of the chadren, if rny, of the marrinee, or as a prombe onch the mainteras it ory deera proper with ruspact to th provisions as it may deera proper with respect to th the marliage; aod may, if it shall think fit, direct prope proceediogs to be taken for placing such children undethe protection on the Court of Clisucery. If the wifo who has been guilty of adultery is entitled to any pro perty, either in possession or reversion, the conrt may, if it think proper, order such eettlement as it may deem reasonable to be made of such property, or any part thereof, for the benefit of the innocent party, aud of the children of the Diarriage, or either of them. - To this country, the formalities ami conzequences of Dare gen rally of $D$ itself the provisions are far frum being uniform in the different states. Thus, in S. Carolitia a disurce is ao allowed for any cause; in Nuw York, only for adultory but in most of the other Stutus it is allowed for adulter cruelty, wilful desertion for a specified period, habitual drunkenvers, de. In sume of the States, inso, the matter is left wholly or in part to the discretion of the cour Geoerally, jurisdiction to grant divorces is conferrel by etatute upon courts of equity, or courts pissessin equity powers. Namerous imi dificult quas sts of divorces eranted by the cuurts of another State. It may bu stated after Bishop (Marriage and Dionrce, c. 32 ) 1. That the tribunals of a country bave no jurisdiction over a cause of tivorce, whereter the offence may have fule domicile withio its territory; 2 . That, to entitle the court to take jurisiliction, it is eufficieot for one of the parties to be doniciled in the conntry; 3 . That the place where the offence was committed, whether in the country in which the suit is brought, in in a forcign conntry, is immaterial; 4 . That the domicile of the parties at the time of the offence committed is of $n$, consequence, the jurisdiction dicpende procculing it instituted, the jud momen rendered. 5 . That it is immaterial to this quention of jurisdiction in what country, or under what system of divorce law, the marriage was celebrated. In Peun-
sylvania, and New Habpshire, pevertheless, it is beld
that the trilnumals of the conutry nlone where the parties were domicilel when the delictast ocenrred tion on this important ant dificult matter, Focourmon puast be hal tur legal trentisen, und to the statntes of the neveral states. Divorce', r. a . [Er. dinorerr; 1at. dierlo, dirrrum, di eolve, us the narrimgetio, rum than to suarite hushan and wife, either totally or partially; us, to divorce an unfaithful wife.

licions food, its reputation among epicures is bot of mod ero date. The name is said to be derived from the Freach gause (ycilow), and 12 to 15 inches in length, thoagh it geaersh, it is from 12 to 15 inches in length, thoogh it of 10 or 12 penads.
Dose, n. [Fr.; Gr, dosis, frem didomi, to give.] The quatity of medicine giveo or prescribed to be taken al one time; as, a dose of jalap. - Anything given to be swallowed; anything nanseovs that one is obliged to take; as, a dose of fulsome flattery.- A quantity; purtion; as nuch as a persoa can swallow.

He married bis pnoctual dose of wires." - Hudibras
a. [Fr. doser.] To give ia doses; to proportion a med icine properly to the patient or disease. - To give med. cine or physic to.-To give anything nnpalatalle or
nausel
Do'sel. Dor'sale, Dos'ser, n. (Arch.) Haogings a ronnd the walls of a ball, or at the east ena, and sumetimes the sides, of tae chas ar or ary silk und told and silver tissue. - A kind of ormamental and rich stuff for the bsck of a chair, a throde, or a and rich stafi for the ornamental wool-work.
Dositheans, n. $\boldsymbol{p}$. (Eccl. Hist.) The name of a religious sect which eprung up in the hrst century of the Christisn ara. Their principal tenets consisted in believing in the divine mission of their leader, Dosithens, from whon they derived their name, and in rejecting the authority and iaspiration of the prophets.
Dosol'ogy, $n$. [Gr, dosil, dose, snd lagos, disconrse.] A diecunre or treatise on the practice of sdministering medicinal dose
Dos'ser, $n$. [From Lat. dorsum.] A pannier, or marketDos'sil, n. [From L. Lat. duciculus.] (Surg.) A pledget; Dost, (dust.) The second sing. person of $d 0$, veed in the solemn style; as, thou dush

Why thee dost treat me with rebukes $?^{\prime \prime}$ - Addison.
Dof. $n$. [Probably from A. S. dyttan, to close or stop up; O. Eng. dot, a small ump or pat; Scot. dotle, a emall particle; allied to jot.] A small point or spot, made as a mark in writing.
(Mus.) A poiat placed sfter a note to increase its duration one half. Formerly the dot was called the point of perfection; becanse a note, wheo dotted, attained its grcateet length, or, in other words, was perfecced. Notted notes are also termed notes of prokohion. Inasminch semibreve equal to three minims. A donble dut placed atter a note increases it to three-fourths its original value: thus, a donble-dotted semibreve wonld be equal to three minims and a half. Rests may also be incruased by the sddition of dots: thns, $n$ dotted semibreve rest ie as long as a semibreve and a minim rest. A doubledotted rest is lengthened in the same nanoer as the sound of a double-dotted nete. Doulife dots are rarely affixed to semibreves or minims. When dots are placed at the sides of double bars, they indicate that the por tions on the dotted sides are to be repuad. Shey are sometimes attached to bimgle bars for precisely the sam purpose.
(Law.) [Fr. dot ; Lat. dos, a marriage-portion ] dowry ; a marringe portion. (Used in louisiana.) relter. To mark, variegate, or diversify with small detached oljects ; as, a field dotted with daisies.
$-v, n$. To make dots, specks, or spots.

Drain'inte, $n$. (.tgric.) The art by which surplus wa-解 water is, as well as other land ia which the excess of low districta containigg thoussinds of acres, or to single fields of comparatively small extent. In the latter caso it is chicfly appliced to render stifi and tenacious clay now fonnd that nu fand of this description can possibly be bronght into proper cultivation without having recourse to this systemer for its umelioration. It is considored better that all draines shonll be cut in the direction of the slope of the fild, which is the direction in which it is ploughed from top to bottom. The trenches for drains gre ent with spades of different widths, the gpper part of the trench beeng taken out with the widest, and a wry nurrow ont, called a bottoming-tool, leing used to firm the bottom of the trench, so that the vertical section of a trench cut for the formantion of a drais exactly resembles that of a fuwer-bot. The toinm of ahout 2 or 3 inches in dianseter, and a thick layer of soil was thrown over them: but, sthbequantly drain-tile and pipes were used withont the addition of any stuns alove them, as the drains were found to be less lable ti obetraction when the whole of the trench above the pipes was filleal in with earth. The tileund-shor drain wis introdaced when the practice of filling the trench withstones was first alnadoned; this consinted of it flat tilc, or shoe, which wis hidd at the bottom of the trunch, and on which nnother tile, arched in form, was phaced Which was of the same length as the shoe on which stood. But these havo beewsipurseded by the cylindri est inchmes in lonath, and from 1 to 6 inchew in alinmuter pipes alsunt $t$ wo tucless in dianuetor are conumunly need for small drams, and the larger cizes, from 4 to 6 inche in datmetor, for snb-main intins. In locke or pouty sciln the pipes shond be connected by collars, but this is not requirmi in orilhary anils. The depth and witth of the trench at the lottom of which the tirain is to he placed muse also bo regnlated, in a groat menanre, by the ma-
ture of the soil. lut it shonld in no coace be leve than 2 ture of the noil : lut it shonld in no cave be lews than 2 feet thor more than 6 fect below the norface. When the druins aro ahont 3 fret deep, and lows than this, they they are docerer than 3 fect, they abonlt lue placed want at diatances varying from so to 70 tiont. drrmire; Sansk. dra, to sleep. Prolialhy allied to Heb. tardéma, deep fleep; formed tron the vound.] The representation of son leas disconnected, the thoned oy arries of thonghts formed by the insagination duriog blerp. - A vain fancy; a reverie; an iolaginary ocenrrence; a visionary echente or specolation: a wild conceit ; an nofounded sumpicion; a vagary; a castle in the air; an illusion.
( $P$ hit. and Physiol.) Dreams sre defined to be "trains of ideas presentiog themselves to the mind iuriog sleep." It frequently, if not slwayn, happens dnring sleep, that while some of the mental facnities are surpended, others are still octive, and are bnsy with nojess regolarity. This is dreeming. It is characterized by an absence of consciousness with regard to external thiogs, and as entire sospension of veluntary control over the curreat of thought, se that the principle of auggestion - one thonght calling up another accornling to the lava of association - has unlimited uperation The subject of dreams is one of the most intricate and perplexing in the entire field of mental philosophy, snd it has not yet met with that amonnt of attentinn that its importance demands. Sir Williman Lamilton believer that, "whether we recollect uir dreams or aut, we alwaye dream." To have no recollection of onr dreanas does not prove that we have not dreamed; for it can often be no trace npon onr memory, Many other philusoplen no trace opon oor memory. Shay other philnsopluer tinctly mitintains that we always dreans when asleup that to cease to drean would be to cease to live; And that those who fancy that they bave not dreant have only forgotten their dreams. The phenomena of dreams also go far to prove, what is now getierihy believed to be true, that different mental faculties have different purtions of the brain apprepriated to them, and throngh which they art. Oue of the most remarkable features of dreamiog is the rapidity with which the nuind pusses through a long to bave elapsed, and a multitude of images may lare heen succersively piled up liefore him, thongh the time accupind therewith is known to have occupied only a few minntes, or even a few seconds. Thus a dresm involving a long snccersion of supposed events has olten originated in sume circumstance that aronsed the sleeper, and taken place within the abort sjace that jrecoded that state of foll cen-cionsiness. The character of a dream is often to tre traced to sume bedsnons feel ing or impression. Thus, Dr. James Gregery having on one occasion gone to bed with a ressel of hot water a his fect, dreaned of walkiog np Monnt Atha, and feel ligg the grobnd warm nnder hios ; and on anorher occaIreant of speoding a winter at Itudson's Bay. Ir Reid. having a badiy-dressed blinter on hir bral, Reid. having a bady-dressed blinter on hir bemil
dreabit of falling into the hands of Indinus, and beidg dreabit of fallidg into the bynis them. We belicre that many more of oor dreams nay be traced to this source thish is commonly magimed, and that many of those umpeasant dreatme that are sumetimes fand to precede illness may lie occasioned hy feelings or senisations of which int the ordinary waking state we are unconncions. It is in this way that indigestion is so fruitiful a canse of anpleassht drratus, of the five sensers, tonch in the noost excitable during slerp, ant mint frequelty modi-
fies the character of nur dreans. The pense of hoaring is the next ; and the least cexcital le uf nill our venars is that of sichit. Our belief io the rcality of the scenes brought before ns, and in the presence of extermal oljectm ont hefore ns, are among the numt culluus sul int portant of the phenomena of $D$. Everything steme rial and vivid lefore ne. Ir. J. Cunninghatu uitempts to es plain this by naintaiming that the uffinity that ex ists between sensations and ideas ingreatel thith is commonly imagined, and that "all thonght is shjective and pictorial. We cannot think, sayn he, "withont thank of of as ouss wo think of that are present to onr conscions. pown. und thue one thinking cunsists of a series of vie bons." Be this as it may, we believe that this phenensenon cannot lic adequately explained Ly referring it to "a complicated case of mesociation," nu is sometimea at tumpted to be done. It is said that $D$. turn most fro quently upon what hire ocropiet our thonghts duriog the day, and that the mast recent assuriations owen nure remilily than thase which sre ware romote. Thin, luwever, we do nut think to he so masch the case as in suppead. The death of a ficont may occupy dur chinf
 all that time hemay no cease to e(cmpy me groat a pal of eur thonghte during the day, that he hegina toapprar to us in sleep. We are rather inelined to the ofdia. pon, that, as a general rule, theme fuenition are nuest In action hariog sleep thint luve lients lease exlaushat durink the tay. We nay, an a kencral rule, for it in wedl hnows that frequently the mini ouy le go excreisul
during the day, that sleep can only fue obluthed with during the dny, that sleep can only he ohbined whay

Ime persons that are drad, or in a distant country, or witRess ovents that havo happenced long avo, in our $D$, and feel ao surprise; but somutimes, also, the ilea that the persout is dead or in a distant cunntry, or that the evest
is a matter of history, also occurs to us; then we are su-prised, and we begin to think that we are dreaming. F'aquently the scenes that appear to ue in our $D$. are bilities, and vev pussibilities, of time, place, and circumstance, are violated, aad yet they rarely etrike us as untrue or improbable. There is also is general a remarkable want of coheronce ia our $D_{\text {., }}$ sud i complete iacongroousness in the thoughts and images thit pass through our minds. Sometimes, however, the very reverse of this takes place, and the reasoniag or imagnative powers may possess a strength noknowa to them is their ordinary condition. Thus Condorcet eaw is his $D$. the final steps of a difficult calculation that had puzzled him during the day; and Cotdillac states that when engaged ished a subjert ia his $D$, which he had troken off before retiring to rest. The popular belief that there is something supecnatural in the nature of $D_{\text {, }}$ and that frequently in this way events are revenled that are about to happen, has beea held from the earliest times, and is shared in by many well-informed persons of the present day Many of the instances of remarkithle $D$. may, doultless, be explained from natural causes, but there are others en well anthenticated that we cannot altogether discredit them, that are manifestly usexplainable
by any satural means. If we almit the teatimony on by any oatural means. If we almit the teatimony on
which these dreams are given, weare driven to confess What they arise from causes, and aresulifect to laws, of which we are ignorant. - It is, iadeed, an interesting question. What purpose do dreaus scrve in the animal they exert a certaia inflnence upos the character "Dreams," says a philologist. "are, at any rate, an exercise of the imagination. We may well conceive that one effect of them nary be to increase the actirity of that faculty during our wakiog hours; and it would be pre suaptuons tu deny that they may not answer sume purpase beyond this, in the economy of percipient sad hanking beings. bight the same thing, it womld perbaps affect us as pow $f$ an artisan were certain of dreaming every night for twelve hours that be was a king, 1 am convinced that he would be almost as happy as a kiag who dreanit every twelve hours that he was an artisio." Hence it is of some importance to stady the art of procuriag pleassut $D$., ou which enlyect Dr. Franklin has an essay A more accurate knowledge of the nature of $D$. would tead to illustrate many of the more obscure mental phenomena. The analogy between dreamiag and in kanity is very striking. There is the same wild disor der of the ineatal faculties, the same rapid and tumulboth. One of the most receat writers on this subject is 3. L. F. Alfred Maury, whose work, Le Sommeil et les Rëves, Eiadrs Paychologivues sur ces Phénomenes et les Rivers Etuts qui s'y rattachent, Paris, 1861, ie well worth the attention of any who are desirous of stadying this subject.
Dreainl, v. $\pi_{c,}$ (imp. or pp. DREAMED, or DREAMT.) [D. armen. T have itleas or imaged in the mind while is the state of slcep. - To isngine: to think idly; to

' Men rf pleasure, dress, and gallantry. ' - Pope.
(Hist.) All uncient nations seem to have had the same costnme, formed of tong garments, without mols shape or ornament ; and as these were all much alike, they desceaded from fither to son for many generations. The culors most valued among the ancients appear to have been purple. red, and violet; but whits was the inost uned by the loraelites, The costumes of the eany Greeks were remarkatienter beigg of later introduction. Among the Romank, the tiga, q. v, a Ireas derived from the Etruecame, was the characteristic costume; and althongh discouraged by Augustus (B. C. 27 -A.D.14), and Domitias ( $\times 1-96$ ), it maintained its popularity till the renoval of the seat of government to Constantinople in 330 , when it was superseded by the Greak palimin, 9. v. When the Romans conquered Western Europe, they of course introduced their costume, which was successively modified and diversified, according to the taste pecniar to every country. From the becinning of from Italy throngh Paris to London. - To attempt in the limits of this work a history seriatim of modern drens, in ite endless variety of nodes, wenld be to record the
 soem to have exhausted its powers of javention in devising coatumes to lend transformation, and even deformity, to the natural beauty and harmony of the hinman frame. Fashion has is all ages proved itself the arbiter of saciety, and is of all things that which it is, perhaps, most difficult to the psyehologist to acconnt for. It may be raid of fashion, as it often is of love, that it disprses 18 to see perfections in the object of onr arllack of enthosiasm. If we look ouly to the mode of

Fig. 8i2. - Drill.
(Mach.) A tool used for boring holes in wood, metal, stone, bones, $k c$. It is formed in different ways, nccording to the kind or hole it is required thich it has to penetrate. Drills for boriog iroo have pointed heads, with sharp elges projecting from them, that cut in different directions. Those for boring woud are like an anger or large gimlet, or they are broad and flat, with a projecting spike in the centre, and cutting-edges on either side: drills of this forma are called contre-bits. These touls are worked by a rotary notion, itpparted to them by a cranked handle, haviog a socket aud spring at one end to receive and hold the
drill, and a lunss at the other, against which the workdrill, and a luns at the other, agaust which the work-
man presses his cheat; or ly a bow of steel, with a man presses his chest; or stroug piece of catgut nttached to it admit of its being passed once or twice round a pulley,
tbrough the centre of which the tool passes. The worktbrongh the centre of which the the paserial that he is boring by his chest, which is protected ly a plate of metal.-A drilling-machine or pross, an apparatus (fig. $873)$ conprising a combination of drills, employed for
entting circular holes io metal. (Called, also, vertical, cntting circular holes io metal
horizontal, or universal drill.)

Fig. St3. - improved mellung-machive.
(Mit.) The general name piveo to the exerciges hy which a soldier is qualified for his duty. Shuad, or setting-up drill, teaches hind how to march in elow, quick, and doublie time, to go through his facings, and
to perform certain situple cyolutions from the balt. or when marching. These are cotubined with posture exercises, ealled $\rho x t$ tension motions, which tend to give the ercises, called extension motioms, whice a gnod carriage, and an erect military figure. Whell the recruit is dismissed from squad drill, which ie taught to smanll batches or equads of men by a eer geant appointed for the purpose, he learns cmpany drill. the mamual and phatoon erercise, and possition drill; be is then competent to go throngh a connse of battalion drill in concert with the other companies of the regiment to which he belones, and to twoeed to aiming
drill, judging-distuncedrill, and tarnet practice. In every regiment every soldier goes through a conrse of setting
up drill. The course of drill fir each arm of the service is sinnlar, as far as the elementary part is concerned:
bine the urtillerymun has to wequiren kuowledke of fun dill, and the trooper must tearn his irill on horechusk, and the swordeexercise. Penishment dritt is un extra quantity of drill nnsigued to a seldier for sothe minor
tallt, which be bas to go through in beusy marehing tault, which be has to go through in beavy marebing
order.

taioed from a species of this genns, hamely. D. Winteri tained from a species of this genns, hamely. D. Wintcri or aromatica. Is nutive of S. America. It was formerly
much nsed as a substitute for cimanon, haviag similar much ased as a substitute for cinnamon, hariag simitar
aromatic and etimulant propertips; at prosent it is aromatic and etimulant properties; at prasent it is
rarely employed. It is sometimes contonnded with rarely employed. It is sometimes contomnded with canelt
Drin, a large river of European Turkey, rising in Al Anuia, sod which, after a course of 100 m ., falls into the Adriatic, 4 m . from Alessio. It was f
ary between the E. and W. Empires.
-Another, in European Tukey, вeparates Bospia from Servia, and, after a course of 150 m , emptiva into the Save, 60 m. from Belprade.
Drink. v. $n$. (imp. DAANE, old spelling DECNK ; pp. DRUNE or naank, old form Drunken: the latter is sometime still used eiljectively.) [A. S. drincan; Ger. triuken To quench one's thitst; to swallow any liquid for ns suaginer thirst, or other purpuse. - To indnlge in spirituons or other potent liquors to excens; to be an habituel drunkard; to be intemperate in the use of wide, \&e.; to tope; to caronse; to fudtlle; to tipple. - To feast; to be entertained with liquors.
To-day it is our pleasure to be drunk."-Fielding.

To drink to. To salute in drinkieg; to toast; to hobTob

## "Let the toast pass; drink to the lass; 111 warrant she"ll prove an excuse for the glass,"-Sheridan.

. a. Tuswallow, as liquids ; to receive, as a flutid into the stomach; to imbibe; as, to drink chamjagne. - To
take or euck in, as a liquid; to aborb; to imbius. - To take io by any inlet of the ouind or seuses; to hear to see. "I drink delicious poison from thy eye."-Pope
-To take in sir; to inspite; to ionale; as, to drink the To drink down. To act on, mollify, or subdue, b drinking
"Come, gentlemen, I hope we shall drink down all notindness."
To drink up; or off. To qnaff the whole st a dranght; to empty ones glass: as, drink up your glass, let ns
drink off and go, - Fo drink the healih of. To drink to drink off and go. - To drink the heallh of. To drink to the health aud welfare of: to pledge : to toakt ; to ex-
press good-will by drioking; us, to drink the lealth of press good-will
the President.
the President be swallowed: any flnid to he taken into the stomach; beverage; potion;-io contradistiaction to nurot.

Meit.) Any liquill sulistances, warm or cold, taken to quench thirst, as a diluent, a beverage, or as a potation. Though water is the natural beveruge of mankind, and the article to whech, in sickness. Womads, and enficrige, all turn with eager yearning, yet, in health and etrength,
how fow out of the millions in civilized life reant to it how few out of the millions in civilized life reart to it
for comfort or refreshnent. If we except the country, where it may be said that the nnsophistiented beverace is the favorite drink, we see this healthful fluid, which assimilates with the hlsod, and carries to the sy repumany of the most importiant prineiples, keneral figuors, whited, if they do not alwnys engender disease. in nimost every case increase the illness, and serionsly derange the vital faculties. Such drinke as are employed for stimulating purposes, whether made with wine, spirits, or alcohol, ur malt liquors, not strictly used as medicinal agents, will be exanined under their proper names, add noder the general head spisitrous ireng. The remainder may be divided into Brecragr and Drink: the first of these, such as connected with the dietetic system of every-day life, and their mode of preparation, and qnalities are 60 intimately known to all, that it is quite enouth to name them in this article. - The class of drinks form a most important suhject in meelieal practice, and are not simply adjuncts to medicine, but
in nll cases importont agrats, and, in many, nbselnte romelirs. Mrelecinal drinke are ilividerl into those pric
 called, phexars, ure ley tur the most mourons and oseful as some of them are not only simply watery hevernaern meant to allay heat and quench the thirst, lout may lo made both to whate fever und smpity the system wish of mourishoent are euch as thoso mado liy luither a fick pootufuls of perl-birley, and a whatl picce of ornage peet, with a little sugar, in three or four pints of water for Alount half an honr, otraming the ligutar, and, whan cold, giving from half a chy to half a thublerfal an ofted as reynirel. Ontucal, riee, saga, memolina, grite, or flour, may bo used for the sume purpose, except that the pumdereal substances are to he first inlxat into a thin pusto with cold water, and mate like grued, by ponring the mixed ingredient into the water, tranging nar constantly stirring the mixruro for the fon mimiter reyansite to
 ontrueat, or barey grim, ens lo memes of acids, comas equally under the denomination of ptisons, or drinks. equally under the denomination of phasoms, or drink. proportioned to the disenke for whleh it is given. When eimplo harley-water, withont flatyor or swectmese, In required, as in cases of fever, or hemorrthage of houl frim the lunge or stomech, the drink may be made perfectly nedicinal by adding about half a irwhim of powtered nitre to each pint for the first class of di-easer, umbly hy the auditiou of one and a half drachmas of the clixir of vitrlol, or of half n drachm of ditutell nitric neld, to each pint of the harley-water, for the Intter:- comartioner
 nara. brenm, and some others. In these cases the ronts ars- washed, eut small, pat on iu cold water, and loiled for n sufficient time to extract their virthes. - Among $t$ ! articles clisefly need for drinks madr by infusion are hyssop, balta, mint, pennyoyal, suge, fennel, wormword, rue, camomile, and many others. As the ofject io giving drinks of this nature is both to quench thirnt and allay beat, by a slight artion on the skin, and at the same time leave a gratefol uromatic taste in the patient's nouth, care lunst he taken not to make the infusion too strong hy adding too much, Water, so freqnently nom earnesty crush for hy the patiunt, to have it first boiled, and then set aside, that an im to have it first boifed, and thens set antide, that misen all the allvantiges obtained from tistilled water will be securel, and a wholesome heverage procured for the invalid, which. by the addition of a little syrup of orange, or copillaire, the expressed juice of hach berrios or currants, may be converted into a grateful, aromatic and cooling drink. - The French are io the hatit of n <ing wormwood, and other etomachic cordials, mixed with water, as an ordinary bunimer drink.
Drink'able, $\alpha$. That nay be drunk, potable; adapted
or fuitable gs a beverago; as, llrimkoble water. or suitable ss a beverago, as, $n$. heverage, or liquor for drinking; as, eatables and

Drink'ableness, $n$. State or quality of being drink Driti
able.
Drinker, $n$. One who drinke or imbibes: particnlarl a persue who is in the habit of drimking ardebt liquors to excess; A tippler; a drunkard; a fuduler; a sot; as a heavy drinker.

Drink ing tsages, n.pl. (Hist.) From the earlie6t times of remote antiquity hore have always been special nsages connceted with the custom or drinking Among the ancient nebrews, the drimk-ofliring constituted one of the most solvin parts of their religions ceremoniea, and consinfed of a mall quantity of winc offering, and the remainder given to the prieste. The patriareh Jacob poured ont a drink-offering on the pillar of etones which he had erected to mark the place where he bal talked with God. (Gen. xxxx. 14) In the $\mathbf{1 5 t h}$ chapter of Numbers there are special direc tions for the pouring out of drisk-off-rings of wine with the burat-off-rings, to lic "a sweet kavonr unto the Lortl:" Among the ancient Greeks und Romans, the pouring ont of libatiuns to the gouds was an ordinnry religions ceremony. They were not only offred hefor colemn prayers, but also hemre mests. In the horcur small pitiation to the gods. This practice was sumewhat equivalent to our grace befire the meat. It was also the ruatum at timen to drink to the health of the gnesta From usares ench as these, in after-time, arose the cns tum of pruposing healths or giving interance to bent ments before drinking at a feant. Among the scandinavians. Teutons, and ancient Britons, eneh usagen wer customary at their boisterons carousals. The Anglio Snxons were in the hasint of crying "Wors hrty (he a health before arinking, whibuted by kime to thi from this nrigin : but in attribelietween Ruwens, the danghter of IIengist, and the British king Vortigern danghter of lieugist, abs was at an entertainmuat at the castle of The king was at an eturertang a fught, lost lis heart to the fuir Rowena, who, kneeling gracefully before him, preeented a coprof wirr, snying, "Liever kynnt:g, wass hol" (dear king, your health). The anss hal of the Saxune was, hownver, in nse liefore that time, and was equira lent to the "Your health" of the present day. Tho practice of pledgiog a guest hefore drinking arose from

## DROM

a necessity of showing that there was no poison in the wine. or that tbere was no daoger to the guest while
bo he drank. It originated in the 10 th cent. The istro-
duction of Cliristianity dit not at all contribute to atol ish the practice of using the wassail cop. It began, on

Fig. 874. - naingino wassall.
the contrary, to assume a religious aspect; and in the larper monasteries, among the monks of chl, the watd asil bowl was placed at the right hand of the abluot in the refectory. It was handed round to each, and wis called
linculum Chearitatis. In the k.מglish universitios a sims foculum craritates. In the k.aglish universition a sim-
ar cup is still pasoed round, called the groce cup. In thi linners gisen by the public companies of the city of Landon, after the cloth has lieen removel, the Master nad wardens rise, and "drink to their visitors in a lov ong copl, and bid them all heartily welcome!" A silver cup filled with warm spiced wine is then handed ronnd to all present. Some of the drinking-cups belonging to the priesthond in the Middle Ages were of the most proseryed; it is male of of thamas a Borkert is still preserved; it is mate of ivory, mounted with silver, and studded on the summit and base with pearle. Round the cup in an inscrijition, Vinum tubm libe cmm
gandio" (drink thy wine with joy); but round the lid
 estute" (be motlerate). The word tnotst, with regard to driuking usatyes, is comparatively modern ; it originated in the practire of putting a piece of toast in a jug of ale. According to "The Tatlir," the worl toast wat Girat applicel to the drinking of healths at Bath, in the reign of Charlee 11. A celelrated beanty of the time was in the large pnblic hath, and a number of her admirurs were standing aroumb. One of them towk a glass another, who was etanding liy, half tipsy, offered to jump in, eaying, that, although he objected to the lition, hu would like to litse the thast. From that time the word wan applied to drinking the heaith of any beanty at privutu partice, anil, in tibse, all sorts of subjects were tomated at pullic and privaty feasts. Tonsts also
began to be accompanied ly cheern; and at the present began to be arcompunied ly cheers; and at the present
duy, at large puilic banqucte, thast-masters are generally duy, at large pulilic banqucte, tonast-masterw are generally
appointed, who not only give out the sulject of the fonst, hat tead the chesern which follow. Many drink ing Hsuges are connected with domestis pevents, and arem to lave been handed down from nncient times. The castom of irinking at lirtha, christonings, nal marriages can rasily le accuinteil for: Int the atrangest wagge of all is the practice of drinking at funcraln. Tho waken Inold in Ireland and some parte of Nentland have huek tong maintminel, and are atill kept up by fintit.
They probably owed thejr origin to the want of exelto They promany owrid inir origin to the want of excitethe lanus thark nights in a cheerlews climate.
Prink'towa, $a$. Withont ilrink.

 "Fefie servanta are al waya aning for drink-money."-Arbuthnot,

IDroppsical, $a$. Diseased with dropsy; predisposed to dropsy; as, a dropsical persotn. - Pertaining to, or par 1)rop'sienalmess. $n$. State or conditiou of bejug af ticteal with dropsy
Drop'stone, $n$. Spar having the form of drops. Dropsiv, h. [Fr. hydropisic; Lat. hydrops; Gr. hydrōps-
hycür, water, nud üps, aspert.] (Med.) A disease char acterized by the accumulation of watery flnitl in one or more shat cavities of the body, or in the areolar tissue or it both imilpendent of inflammation. In a state of bealth, the capillaries, which ramify every part of the budy, constautly poar ont upon every sarface, into the
most minnte cellsas well as the great cavities, a watery most minute cells as well as the great cavities, a watery fluid to moister the paits, and thereby facilitate motion and preveat injary from frictiun. This watery fluid is epeedily abson up by avother class of vessels, called the When the healtiny condition of these organs is impaired either from the exhalants acting two powerfally from the absorbents being deficient inaction, antaccmmnlation of flaids takes place, either iu the general cellular membrabe or in the thitural cavities of the body. $D$. is either active or passitc. Active or acnte $D$. is owing to excessive action of the exhalauts, in consequence of increased action of the heart; it comes on suddenly and
tumaltuously, and sometimes can scarcely be discrimitumnltuously, and sometimes can scarcely be discrimi-
nated from inflammation with serons effasion. It is nated from inflammation with serons effasion. It is induced by varions causes; as exposare to h cold nois
atanosphere, particalarly when the body is in a state of perspiration from active exercise or long exposure t peat. Chronic or passice $D$. is occasioned by defectiv absorption, arising, in some measure, perhaps, from an ically so called, but more frequently, chicfly, and is sums eases eotirely, from undtue fulvess of the veins this venons repletion being produced almost always hy 6ome impediment to the free retarn of the blood to the
heart; as tumors pressing on the great blood-yessels beart; as tumors pressing on the great blood-vessels
ossification of the ralves of the lueart, de. When the ossification of the valves of the leart, \&c, When the
veins are distevded to ucertain degree with watery fluid, veins are distended to "certain degree with watery fluid, the entrance of more of the same fluid throngh their sides is impeded or prevented; and when the distention
is still greater, the agneons part of the blood may even pass in the other direction ont of the ressel may even pass in the other direction ont of the vessel. The dif rerence betweeth active and passive $D$. is chichly in the
rate collection angments; in the one case the liquid is rapidly effused in quantity innch bryond the natural amount of exlialation, in the other the cxhalation goes on as usual, but the fluid exhated ia not taken back egain into the circnlatiog vessels with sufficiedt frcility. Wherever there is a shut sac, or wher ever there is a lonse and permenble areolar tiesme, there we may bave $D$. There are certaia parts, bowever, where it is more generally met with than in others, and is hence distingnished by particnlar names; thas, when in the belly, ascites; in the areplar tissue generally throbghout the body, anasarca. When the areolar tisand throbyhout the body, anasarca. When the areolar tissin
of a part becomes dropsical, it is said to be odematous In the treatment of tbis disense, the first object is to get rid of the preternatnral accumulation of watery flaid the second, to prevent its collecting again; for $D$, is geaerally a symptom or sequence of otber disorders, and rarely a disease itself. In active or fehrile rnasarca, ged eral blood-letting is often of great advantage, as it mor only helpa to relitve the congestion upon which the effusion depends, but it tends to abate the undue action would bevery injurious, from its enferbling the patient and as it frequently occurs frum weakness, or living on puor or unwbolesome food, the treatinent mor living on of a generous diet, with tonics. In general the object is to augment the discharge of watery fluid from one more of the secreting sarfaces of the lody; and it is often a matter of great nicety to determine by whi
surface or chaonel this ought to beatterpted. In som
cases it is heat ta wnok to promote thin discharge ty way atimentary camul; in others, hy the externat skin. sometinus great pirment relicf is aflordial to the patant by tapping: lat it in kuncully ouly temporary, and can (But.) lation of their religious festivals, ioasmuch as they compoted the yearly lonations, which supposers an acquantance alsu with the solar yenr, and various reaice have beell found in Irelanf, among Druilical remains, signed to show the phases of the moon. At the same time, there was not a little of astrology, divioation, and magic mixed op with their purer science. In their doctrine of oedicine particuharly, there was far more of saperstition that of kwowledge. To a great many plants they sttribated a sacred, mystic character. The oak was especially regarded as sacred emong them, and in the oak-groves they frequently performed their rites, deriviag, according to some, their name from the oak. Most sacred of all, howeser, was the mistletoe, which they esteemed as an matidote to all poisons, a cure fot the nust furmal and pompous ceremonies Accordiog the nust formal and pompons ceremonies According $D$. collected in crowds abont the tree; a priest in whito $D$. collected in crowds abont the tree; a priest in white
vestunents ascendud, and, with a knife of gold. cut the mistletoe, which was received by anuther standing on the ground; sacrifices were offered up. and the day spent in rejoicings. There were certain other plants which were regarded as potent remedies for varions diseases, and were carried abont as charms, as well ae amber beads, which the $D$. mannfactured for warriors in battle, and which are still found in their tombs. A the serpent's It was formed, he says, by the poithenous spittle of a crat many serpents twined together It was gathered by moonlight, nad afterwards worn in the bosom. Their profonnder ceremonies, those which they celebrated in the depthe of the onk-forests or of secluded caves, are known to- us only thrangh the most vague traditions, and in the stupendons bnt dilapidated stono monmments which still exist in some parts of France and Britain. It is said that hnman sacrifices

Fig. 8i5. - druidical bacrifice.
were frequently offered up npon their altars. They consisted of threc distinct clums - The bards wemp pocts, prophets, and the pieste proper. The bardin were poets, cal clabs, The vatcs were the diviners or revealers of the fnture, who were chargell with the conduct of sac rificer and otber external ceromonies, and who stood as medintore or interpreters hetween the prople nad the highier order of prieata. These dwelt in the depths of the oak-forests, cnltivating the moro aecret and anyatic doctrines of their faith. They exmeined judicial functions, und were resorted to in grent numbers by the youth for inatruction. When Gaul was anlidued ly the
Romans, the Druidicul religion gradnally retirel liefors Komans, the Druidien religion kradualy retirmi hefor first into Armorica, and then into tirent Britain, where, In the time of Nero, it wan at tacked, and mostly supprosest. It lingered sa a patblic worship longest in the fistand of Angleacn, whenco it was fanally driven ont liy the loman troopk, nabid a great deal of slanghter Nevertheless it continued, an a superntitions behef, to lurld sway for many yours thervafter wver the minde of the Cultic tribes and them desceniante.

Franesoia I. oprenly cocouragell it, and ant an example ly clathenging Charlow V. Reveral hiseffictna

pf Henri IV., that in the first eighteen years of his reign 4,000 reatlemen lost their lives in duels. Hepri Was compellet by popalar reeng roeudeatvor to nbolish peoalties then in furce de, owere did nut ose the an mafavorable eye upon $D_{\text {; }}$; consequently althonah very anlawfal, it liecane very fashionable. finring the reifo of Lonis XIII. $D$, becameso prevalent that it was eaid iu Poris that no Freochonal was worth looking at onless be had killed bis mita. Although D. Was socompmon, the law agaiast it was carried ont with great rigor, and several noblemen and gontlemen of high renown were beheaded for persisting in fichting. During Lonis XII. e reign, duels of three, tour, and five a side were common; but the king at last enferced the laws with such firmaess, that, for the time, $D$. Was alawst England abont the time of the Nurman Congnest. lat it was principally in its pablic or judicial forma Private $D$. was very prevaleot in the reign of Queen Elizabeth. It declibed daring the Commonwealtht, lint trake ont again in the reipa of Charles 11. Duriag the reiga of Williem III. attempts were mate to alrolish $D$.; aush in 1712 a lill was introdnced into Parliabient, Jut was thrown out, notwithstanding that its objects had been strongly advocated in Qneen Anties sppech. After the wearing of ewords way absindoned, $D$. diminished for a time: but the pistol 600 n liegan to take the place of that weapon. Afler a time, chance touk the place of two or three paces, ous pistol being lended and the other not. This sort of $D$. suems tu have reached its climax when the disputants made choice by lot between two pills, one made of lircad, and the other containing poison. Erom this guint $D$. declined, and has now quite fallen into disrepute; in England, indeed. it may he said to bo abolished. By the laws of that country, any nan killing rauther in a daet, however fair it may have been, is considered kuity of morder; lot in Fagland, as in France, $D$. is not looked apon wofavoralily by the pablic, and ne jury has been foutd who would conrict any one clarized, io the case of a fiur duel. The dhets among shirre weapons and althong sone ugly cuts in tho share weapons, and airoogh eone ugly cuts is tho lutely danger ne, as armed seconds are alwigs on the alert to prevent any eerions wonnds, $D$. has been known in the U . States since the oriminal settlement, the first duel taking place in 1621, at Plymonth. Among the mast celebrnted duele fonght in this countsy are the following: Gea. Hatmilon and Col. Burr, in $] \times 04$, ja which the former was killed; Heory Clay and Joln Randolph, in 1826: Eenton. in clubing his acconnt of the fight, says: "Certainly duelling is bad, but not quite so bad as its substitutes-revolvers, bowie-knives, blackguarding, and street assassination onder the pretence of self-defeuce." Gell, lackson killed Mr Ditkinom in a duel, aud was alsoengaged on other nffirs. Cul. Benhis hands. By the common law, when once of the parties to a duel is killed, the survicor and the seconds are guilty of murder, and the participante in a duel where there is no fatal resalt, are beld linble formisdem-man; hat muny of the States have modified this rule by legislative ebactment, nod in more than half the Coiou the legisintion againet duelling has licen ineffective. In the Northern States, nevertheless, the force of epinion is strongly against dnelling. In the Ametican navy and army, an officer implicated in n duel with a brother officer. either as phation or second, is liable to be cablicred upon convering a court-martial
fite. for a doel. as, duelling pistuls, the to, a duel; requiDa'ellist, $n$. A dueller one who macts and fiehte Dancllist, n. A dueller; one who mucets and fights hollet the theory and practice of duelling; es, in nuted duellist.

D. scale. An operation or rule by which the costents or any surface or solid are estimnted by multiplying toand lioes. It is principally used hy coutractora and artiti ers in finding the contento of their work. Crussmiltiplication is anotaer term applied to the same byotem of catculation. As an example, supposid it were required to ascertaiu the superficial cuntents of a pieco of timber 1- ft. $91 / 2$ inches ong and 3 . 7 in . Whate. In Jeput under the other the feet being phaced under the feet und the juches nnder the inches. The halt inch is expresed in limen, 6 iines guing to the halt-inch, $1: 2$ lides to the full inch. In this calculation, ft. ure considered as pnits of measure, and inchesare semany twolfthe of units. The units thus form the first place in the colone hundred and forty-fourths the third. When the first live is multiphed by 3 fee (61/2 foot, and $I_{i f}^{6}$ of a foot. When the upper line is moltiplied by $⿳^{7} 2$, the eix
lines are made equal to $\frac{1}{1} \frac{2}{2} \frac{2}{8}$. The $\frac{9}{12}$
I 20
$1 / 2$ multiplied by $\frac{7}{12}$ are equal to $\frac{6,3}{1+4}$, which, added to the other, make $\frac{665}{144}$, or $1^{5} 5^{\text {and }} \frac{6.5}{1+4}, 61 / 2$ ie therefure placed in the third column, and the $\frac{5}{2}$, io cas riwil forward. The ulitimute result is as uhove, 45 sq. $\Omega$. and $1201 / 2$ sq. inclue. To practical men the operution beginuers have great difficulty in nuatering it. The $D$, S. is not gemerally inserted in ordinary booke of practical mrithmetic.

Dupirt, Andre Marie Jeax Jucqees, (dōópang.) a distinguislred French jurist and statesmam, B, at Faryz, dep. Nière, 1i82. He was familiarly knowo as Dupin
Luiae, being the ehlest of three brothers, all of whom obteined distinction ; and of whose mother it is related that sho desired no other epitapis than this - mother of the three Dapios. André was brought up to the law and was called to the bar in 1802. He rose to high reputution in bis profession, and in 1811 was named nember of the conmissson appointed for the classitication of the laws of the empice. depary to the Chamber of Representatives and with great firmness and indepeudence resisted the and with great farmoless and his adherents to save the last efforts. IIe supported the Restoration, but was soon driven by the follies and tyranny of the government to become its stont and persistent opponent. Ilis greatest reputation as adrocate wis won in those days when be was the zealons and powerful defender of the freelom of the press, aod of the adherents of the fillen dyniasty who were 6 nhjecteid to prosecution. He tork pirt with the two Berryers in the defence of Marshal Ney; drfunded
Sir Robert Wilwon and his associates, who aided the escape of Lavalette; and among others also defended (ren. S vary, De Pradt, and the popular poet Beranger. On
of lis most celehrated efforts was the succesuful defeac of the Journal des DÉbats, in 1829. He remained a pol ular leader thronghout the reign of Charles $X_{\text {, and wis }}$ measures for the elevation of Lonis Philipue, Duke p. rleans, to the throne, be tork an influential part ; and the king, whose consulting lawyer he had been since 1820, rewarded bim with the appointment of Procirent Genéral to the Conrt of Cassation, which he helli for twenty-two years. Lte was a firm supporter of the gov ernment, and mide himself napopular by condemang revolntionary excesses. till 1840 . At the revolution of Feb.. 18tk, it was $D$. who presented the young Camte de Paris to the Chamber of Drpnties, and proposinl hie election as king under the regency of the Duchess of Orleans. He was un active member of the Coustiturnt, nad afterwards of the Leqislative, Assembly ; and was presudent of the latter. He remained passive at the Cunp d'Etat of 21 Dec., 1551 , but on the confiscation of the property of the Orleans family, he restgned his post of Procurear-Général, and retired from public life. To the surprise of his fri-nds he resomed it, and became a senator in $185 \overline{7}$; thas lending the weight of his naiue und character ho thesysten saying that be lad ever belnoged to France, bat aever to poy political parties. $D$. was Grand Cross of the Lugion of Honor from 18:37, member of the French Acalemy vince 1832 , and member of the Institute. D. at Paris, 1865.
D., Charles, Barov, brother of the above, a. 1784 . He entered the Fronch navy in 1803 , as an engineer, and
became professor of mechaoics and the physical sciences becume professor of mechavics and the physical sciences
in the lonian Academy, which lie :ssisted in forming, at Corfn. In 1812, he retarned to Pario, add, in 1813. inxtituted the Maritime Minseurn at Tonlon. IIe was a member of the Chamber of Depnties from 182. and when the chanze of constituent assembly, and also in the Legslative Assembly. After the revolntion of 185l. he became a sunator. He has written a great number of important works connected with the science of engineering. D. 1873.
